

BQ77207 具有内部延迟计时器、适用于 3 节至 7 节串联锂离子电池的电压和温度保护器

1 特性

- 3 节至 7 节串联电池保护
- 高精度过压保护
 - 25°C 时为 $\pm 10\text{mV}$
 - 0°C 至 60°C 时为 $\pm 20\text{mV}$
- 3.55V 至 5.1V 的过压保护选项
- 1.0V 至 3.5V 的欠压保护选项
- 开路连接检测
- 使用 NTC 或 PTC 的过热保护
- 支持电池随机连接
- 提供功能安全
- 固定内部延迟计时器
- 固定检测阈值
- 固定输出驱动类型，适用于每个 COUT 和 DOUT
 - 高电平有效或低电平有效
 - 高电平有效驱动达 6V
 - 漏极开路，可从外部上拉至 VDD
- 低功耗 $I_{CC} \approx 1\mu\text{A}$ ($V_{\text{CELL(ALL)}} < V_{\text{OV}}$)
- 每节电池输入具有小于 100nA 的低泄漏电流，且禁用开路检测
- 封装尺寸选项
 - 12 引脚 WSON，引线间距为 0.5mm

2 应用

- 锂离子电池组保护，可应用于：
 - [手持园艺工具](#)
 - [手持电动工具](#)
 - [无线真空吸尘器](#)
 - [UPS 备用电池](#)
 - [轻型电动车辆 \(电动自行车、电动踏板车、踏板辅助自行车\)](#)

3 说明

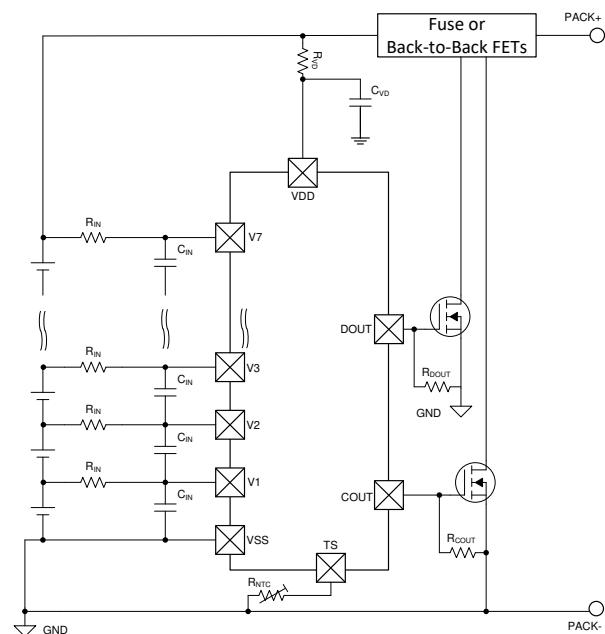

BQ77207 产品系列提供了多种电压和温度监控功能，包括适用于锂离子电池组系统的过压 (OVP)、欠压 (UVP)、开路 (OW)、过热 (OT) 保护，可独立监控每节电池是否具有过压、欠压和开路情况。通过增加外部 NTC 或 PTC 热敏电阻，该器件可以检测到过热情况。

当检测到存在过压、欠压、开路或过热情况时，BQ77207 器件即启动内部延迟计时器。延迟计时器过期时，将触发相应的输出进入其工作状态（根据配置的不同，为高电平或低电平状态）。

器件信息表

器件型号	封装 ⁽¹⁾	封装尺寸 (标称值)
BQ7720700	WSON (12)	3.0mm × 2.0mm

5 说明 (续)

如果检测到过压故障，将触发 COUT 引脚。如果检测到欠压故障，将触发 DOUT 引脚。如果检测到过热或开路故障，则同时触发 DOUT 和 COUT 引脚。为了实现更快速的产品线测试，BQ77207 器件可提供延迟时间大幅减少的客户测试模式 (CTM)。

7 Pin Configuration and Functions

图 7-1. BQ77207 Pin Diagram

12-Pin Functions

NO.	NAME	TYPE ⁽¹⁾	DESCRIPTION
1	VDD	P	Power supply
2	V7	I	Sense input for positive voltage of the seventh cell from the bottom of the stack
3	V6	I	Sense input for positive voltage of the sixth cell from the bottom of the stack
4	V5	I	Sense input for positive voltage of the fifth cell from the bottom of the stack
5	V4	I	Sense input for positive voltage of the fourth cell from the bottom of the stack
6	V3	I	Sense input for positive voltage of the third cell from the bottom of the stack
7	V2	I	Sense input for positive voltage of the second cell from the bottom of the stack
8	V1	I	Sense input for positive voltage of the first cell from the bottom of the stack
9	VSS	P	Electrically connected to IC ground and negative terminal of the lowest cell in the stack
10	COUT	O	Output drive for overvoltage, open wire, and overtemperature. It can be left floating if not used.
11	DOUT	O	Output drive for undervoltage, open wire, and overtemperature. It can be left floating if not used.
12	TS	I	Temperature sensor input. If not used, leave it NC.

(1) I = Input, O = Output, P = Power Connection

8 规格

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage range	VDD - VSS ⁽²⁾	- 0.3	45	V
Input voltage range	Vn - VSS where n = 1 to 7	- 0.3	45	V
	TS	- 0.3	1.5	V
Output voltage range	COUT - VSS, DOUT - VSS	- 0.3	45	V
Functional temperature, T _{FUNC}		- 40	110	°C
Storage temperature, T _{STG}		- 65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) DC Voltage applied on this pin should be limited to a maximum of 40 V. Stresses to this pin at voltages beyond this level, up to the 45-V specified maximum level, should be limited to short transients.

8.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002, all pins, all pins ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{DD}	Supply voltage ⁽¹⁾	5		38.5	V
V _{IN}	Input voltage range of Vn - Vn-1 where n = 2 to 7 and V1 - VSS	0		5	V
	TS	0		1.5	V
V _{CTM}	Customer Test Mode Entry V _{DD} > V7 + V _{CTM}	12		13	V
C _{TS}	Total capacitance on the TS Pin			200	pF
T _A	Ambient temperature	- 40		85	°C
T _J	Junction temperature	- 65		150	°C

- (1) V_{DD} is equal to top of stack voltage.

9 Detailed Description

9.1 Overview

The BQ77207 family of devices provides a range of voltage and temperature monitoring including overvoltage (OVP), undervoltage (UVP), open wire (OW), and overtemperature (OT) protection for Li-ion battery pack systems. Each cell is monitored independently for overvoltage, undervoltage, and open-wire conditions. With the addition of an external NTC thermistor, the device can detect overtemperature conditions. An internal delay timer is initiated upon detection of an overvoltage, undervoltage, open-wire, or overtemperature condition. Upon expiration of the delay timer, the respective output is triggered into its active state (either high or low depending on the configuration). The overvoltage triggers the COUT pin if a fault is detected, and undervoltage triggers the DOUT pin if a fault is detected. If an undertemperature, overtemperature, or open-wire fault is detected, then both the DOUT and COUT are triggered.

For quicker production-line testing, the BQ77207 device provides a Customer Test Mode (CTM) with greatly reduced delay time.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Voltage Fault Detection

In the BQ77207 device, each cell is monitored independently. Overvoltage is detected by comparing the actual cell voltage to a protection voltage reference, V_{OV} . If any cell voltage exceeds the programmed OV value, a timer circuit is activated. When the timer expires, the COUT pin goes from inactive to active state. The timer is reset if the cell voltage falls below the recovery threshold ($V_{OV} - V_{OV_HYS}$). Undervoltage is detected by comparing the actual cell voltage to a protection voltage reference, V_{UV} . If any cell voltage falls below the programmed UV value, a timer circuit is activated. When the timer expires, the DOUT pin goes from inactive to active state. The timer is reset if the cell voltage rises below the recovery threshold ($V_{UV} + V_{UV_HYS}$).

图 9-1. Timing for Overvoltage Sensing

图 9-2. Timing for Undervoltage Sensing

9.3.2 Open Wire Fault Detection

In the BQ77207 device, each cell input is monitored independently to determine if the input is connected to a cell or not by applying a 50- μ A pull down current to ground that is activated for 128 μ s every 128 ms. If the device detects that $V_n < V_{n-1} - V_{OW}$ V, then a timer is activated. When the timer expires, the COUT and DOUT pins go from an inactive to active state. The timer is reset if the cell input rises above the recovery threshold ($V_{OW} + V_{OW_HYS}$). To recover both the COUT and DOUT output from active to inactive state, the open wire fault must be cleared (such as the broken connection from the device to the battery needs to be restored), and any other remaining faults (such as existing OVP or UVP faults) need to be cleared as well.

9.3.3 Temperature Fault Detection

In the BQ77207 device, the TS pin is ratiometrically monitored with an internal pull up resistance R_{NTC} . Overtemperature is detected by evaluating the TS input voltage to determine the external resistance falls below a protection resistance, R_{OT_EXT} . If the resistance falls below the programmed OT value, a timer circuit is activated. When the timer expires, the COUT and DOUT pins go from inactive to active state. The timer is reset if the resistance rises above the recovery threshold ($R_{OT} + R_{OT_HYS}$). If external capacitance is added to the TS pin, it needs to be within the spec limit shown in recommended operating conditions.

备注

Texas Instruments does not recommend adding an external capacitor to the TS pin. The capacitance on this pin will affect the TS measurement accuracy if greater than C_{TS} .

9.3.4 Oscillator Health Check

The device can detect if the internal oscillator slows down below the f_{OSC_FAULT} threshold. When this occurs then the COUT and DOUT go from inactive to active state. If the oscillator returns to normal then the fault recovers.

9.3.5 Sense Positive Input for Vx

This is an input to sense each single battery cell voltage. A series resistor and a capacitor across the cell for each input is required for noise filtering and stable voltage monitoring.

9.3.6 Output Drive, COUT and DOUT

These pins serve as the fault signal outputs, and may be ordered in either active HIGH with drive to 6V or active LOW options configured through internal OTP.

The COUT and DOUT will respond per the following table when a fault is detected, if the specific fault is enabled.

表 9-1. Fault Detection vs COUT and DOUT Action

FAULT Detected	COUT	DOUT
Overvoltage	Active	Inactive
Undervoltage	Inactive	Active
Open Wire	Active	Active
Over Temperature	Active	Active
Oscillator Health	Active	Active

9.3.7 The LATCH Function

The device can be enabled to latch the fault signal, which effectively disables the recovery functions of all fault detections. The only way to recover from a fault state when the latch is enabled is a POR of the device.

9.3.8 Supply Input, VDD

This pin is the unregulated input power source for the IC. A series resistor is connected to limit the current, and a capacitor is connected to ground for noise filtering.

9.4 Device Functional Modes

9.4.1 NORMAL Mode

When COUT and DOUT are inactive (no fault detected) the device operates in NORMAL mode and device is monitoring for voltage, open wire and temperature faults.

The COUT and DOUT pins are inactive and if configured:

- Active high is low.
- Active low is being externally pulled up and is an open drain.

9.4.2 FAULT Mode

FAULT mode is entered if the COUT or DOUT pins are activated. The OUT pin will either pull high internally, if configured as active high, or will be pulled low internally, if configured as active low. When COUT and DOUT are deactivated the device returns to NORMAL mode.

9.4.3 Customer Test Mode

Customer Test Mode (CTM) helps to reduce test time for checking the delay timer parameter once the circuit is implemented in the battery pack. To enter CTM, VDD should be set to at least V_{CTM} higher than V7 (see [图 9-3](#)). The delay timer is greater than 10 ms, but considerably shorter than the timer delay in normal operation. To exit Customer Test Mode, remove the VDD to a V7 voltage differential of 10 V so that the decrease in this value automatically causes an exit.

CAUTION

Avoid exceeding any Absolute Maximum Voltages on any pins when placing the part into Customer Test Mode. Also avoid exceeding Absolute Maximum Voltages for the individual cell voltages ($V_{Cn} - V_{Cn-1}$) and ($V1 - VSS$). Stressing the pins beyond the rated limits may cause permanent damage to the device.

图 9-3 shows the timing for the Customer Test Mode.

图 9-3. Timing for Customer Test Mode

10 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

10.1 Application Information

Changes to the ranges stated in 表 10-1 will impact the accuracy of the cell measurements.

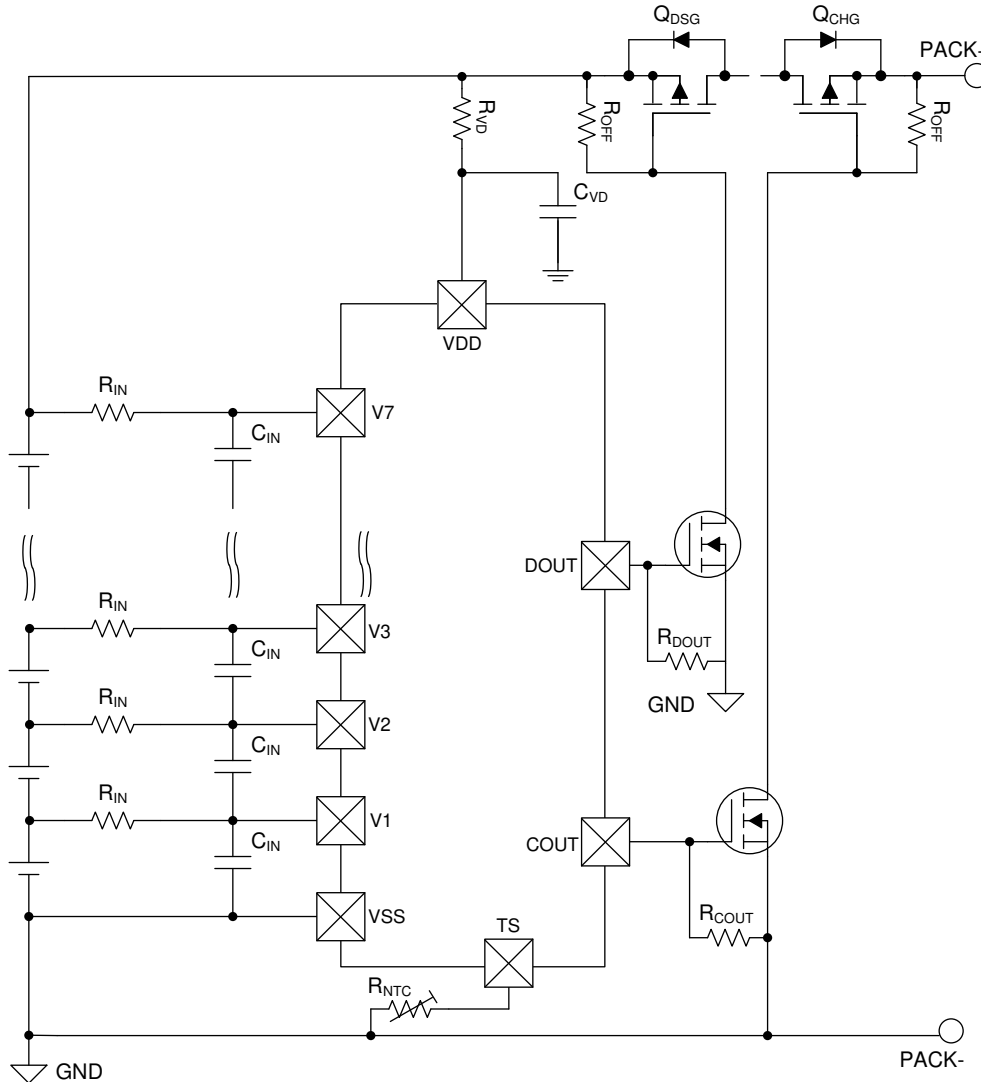

图 10-1. Application Configuration

10.1.1 Design Requirements

Changes to the ranges stated in 表 10-1 will impact the accuracy of the cell measurements. 图 10-1 shows each external component.

表 10-1. Parameters

PARAMETER	EXTERNAL COMPONENT	MIN	NOM	MAX	UNIT

Voltage monitor filter capacitance	C_{IN}	0.01		0.1	μF
Supply voltage filter resistance	R_{VD}	100	300	1K	Ω
Supply voltage filter capacitance	C_{VD}	0.05	0.1	1	μF

备注

The device is calibrated using an R_{IN} value = 1 k Ω . Using a value other than this recommended value changes the accuracy of the cell voltage measurements and V_{OV} trigger level.

10.1.2 Detailed Design Procedure

图 10-2 shows the measurement for current consumption for the product for both VDD and V_x .

图 10-2. Configuration for IC Current Consumption Test

10.1.2.1 Cell Connection Sequence

The BQ77207 device can be connected to the array of cells in any order without damaging the device.

During cell attachment, the device could detect a fault if the cells are not connected within a fault detection delay period. If this occurs, then COUT and/or DOUT could transition from inactive to active. Both COUT and DOUT can be tied to VSS or VDD to prevent any change in output state during cell attach.

10.2 Systems Example

In this application example, the choice of a FUSE or FETs is required on the COUT and DOUT pins—configured as an active high drive to 6-V outputs.

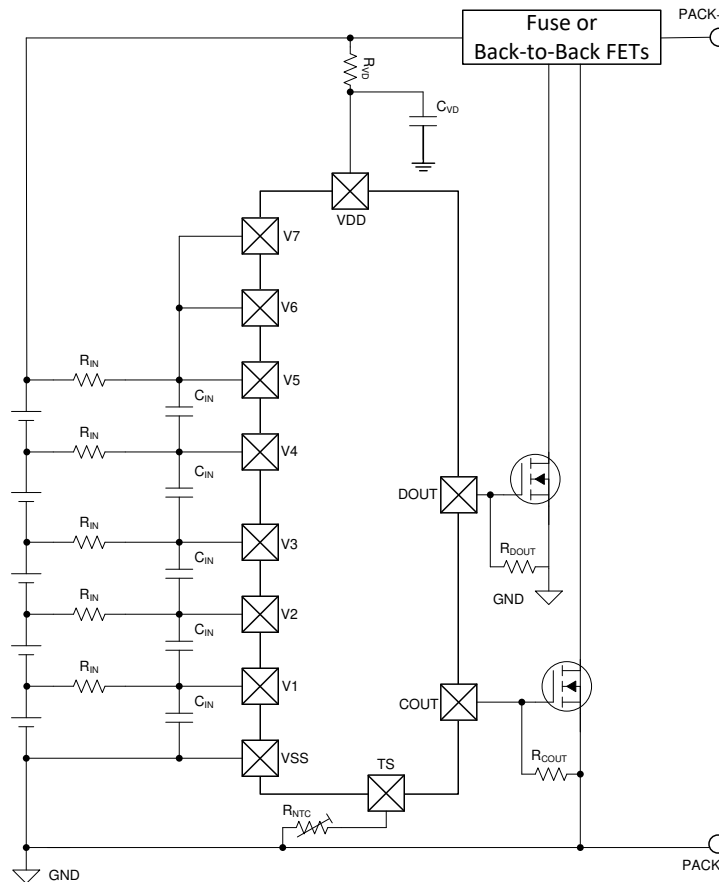

图 10-3. 5-Series Cell Configuration with Active High 6-V Option

When pairing with the BQ769x2 or BQ76940 devices, the top cell must be used. For the BQ77207 device to drive the CHG and DSG FETs, the active high 6-V option is preferred. Its COUT and DOUT are controlling two N-CH FETs to jointly control the CHG and DSG FETs with the monitoring device. For such joint architecture, the open-wire feature of the BQ77207 device may be affected if the primary protector or monitor device is actively measuring the cells. Care is needed to ensure the V_{OW} spec of the BQ77207 device is met or to choose a version of the BQ77207 device with open wire disabled. When working with a BQ769x2 device, the LOOPSLOW setting of the BQ769x2 device should be set to 0x11 to ensure the BQ77207 V_{OW} spec is met.

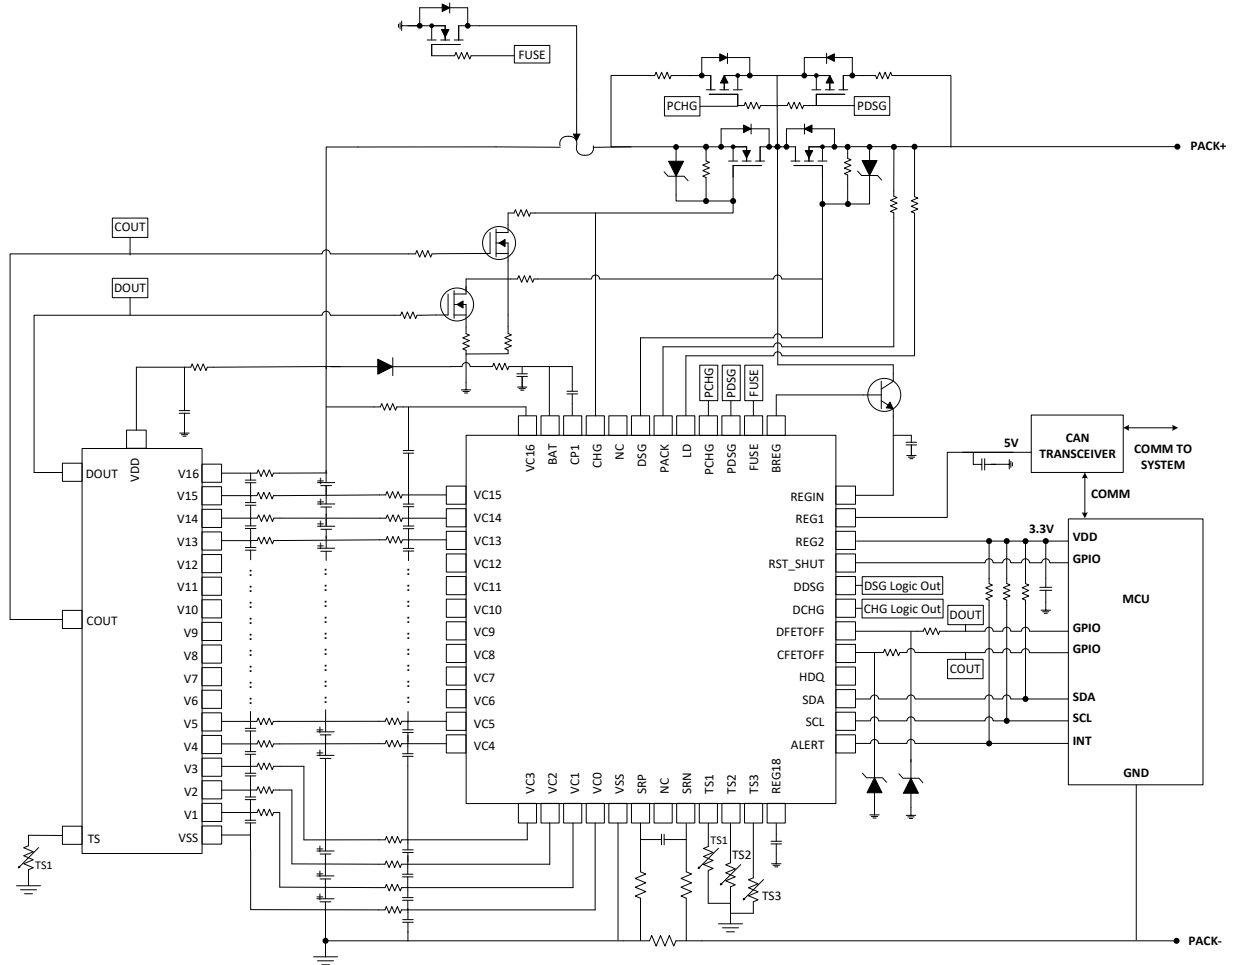

图 10-4. BQ77207 with BQ76952

11 Power Supply Recommendations

The maximum power supply of this device is 38.5 V on VDD.

12 Layout

12.1 Layout Guidelines

- Ensure the RC filters for the Vn and VDD pins are placed as close as possible to the target terminal.
- The VSS pin should be routed to the CELL - terminal.

12.2 Layout Example

图 12-1. Example Layout

13 Device and Documentation Support

13.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

13.2 接收文档更新通知

要接收文档更新通知，请导航至 [ti.com](https://www.ti.com) 上的器件产品文件夹。点击 [订阅更新](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

13.3 支持资源

[TI E2E™ 支持论坛](#) 是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《[使用条款](#)》。

13.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

13.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

13.6 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
BQ7720700DSSR	ACTIVE	WSON	DSS	12	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 110	720700	Samples
BQ7720701DSSR	ACTIVE	WSON	DSS	12	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 110	720701	Samples
BQ7720702DSSR	ACTIVE	WSON	DSS	12	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 110	720702	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

DSS0012B

PACKAGE OUTLINE

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

4218908/A 01/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.
