

适用于汽车内部显示的 DLP3020-Q1 0.3 英寸 WVGA DMD

1 特性

- 已通过汽车认证
- 0.3 英寸对角线微镜阵列
 - 7.6 μ m 微镜间距
 - $\pm 12^\circ$ 微镜倾斜角 (相对于平面)
 - 用于效率优化的侧向照明
- WVGA (864 \times 480) 分辨率
- 偏振无关型空间光调制器
 - 与 LED 或激光光源兼容
 - 可通过偏光眼镜看到图像
- 低功耗: 105mW (典型值)
- 工作温度范围: -40 $^\circ$ C 至 105 $^\circ$ C
- 具有 7.0 $^\circ$ C/W 热效率的气密封装
- 可实现系统内验证的 JTAG 边界扫描
- 与 DLPC120-Q1 汽车 DMD 控制器兼容
- 78MHz DDR DMD 接口
- 与 DLP3030-Q1 具有相同的微镜阵列, 但封装尺寸更小

2 应用

- 宽视场和增强现实抬头显示 (HUD)
- 数字仪表组、导航和信息娱乐系统挡风玻璃显示
- 车内投影显示和照明

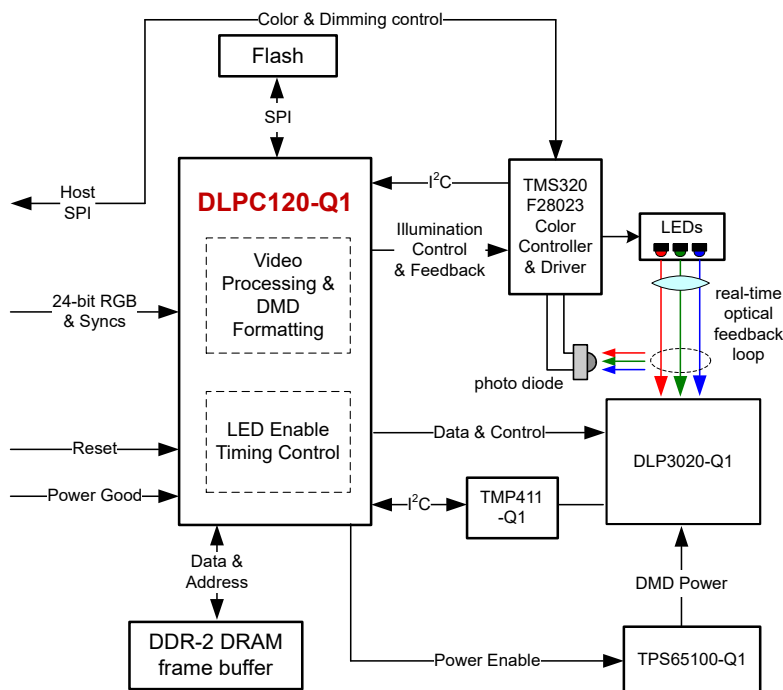

3 说明

DLP3020-Q1 汽车 DMD 主要面向具有大视场或增强现实功能 (需要长焦距) 的汽车抬头显示 (HUD) 应用。该芯片组能够与 LED 或激光器搭配使用, 以生成具有 125% 以上 NTSC 色域的深度饱和颜色并支持 24 位 RGB 视频输入。此外, 该芯片组可以凭借宽动态范围和快速开关功能 (不随温度的变化而变化) 实现高亮度 (15,000cd/m² 典型值) HUD 系统。当用于 TI 参考设计中时, 能够实现超过 5000:1 的极高动态范围, 以满足汽车 HUD 系统针对明亮的白昼和黑暗的夜晚驾驶条件的工作范围要求。该器件与 DLP3030-Q1 具有相同的微镜阵列, 但封装尺寸更小, 从而可以减小光学系统设计的整体体积。

器件信息

器件型号 ⁽¹⁾	封装	封装尺寸 (标称值)
DLP3020-Q1	FQR (64)	8.55 mm \times 16.80 mm

(1) 如需了解所有可用封装, 请参阅数据表末尾的可订购产品附录。

5 Pin Configuration and Functions

图 5-1. FQR Package, 64-Pin LGA (Bottom View)

表 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
DATA(0)	A2	LVCMOS input	Data bus. Synchronous to rising edge and falling edge of DCLK.
DATA(1)	A4		
DATA(2)	B2		
DATA(3)	B3		
DATA(4)	B5		
DATA(5)	C2		
DATA(6)	C3		
DATA(7)	B4		
DATA(8)	C5		
DATA(9)	D2		
DATA(10)	D3		
DATA(11)	D4		
DATA(12)	D5		
DATA(13)	E2		
DATA(14)	F5		
DCLK	F4		Data clock.
LOADB	F3		Parallel latch load enable. Synchronous to rising edge and falling edge of DCLK.
SCTRL	E4		Serial control (sync). Synchronous to rising edge and falling edge of DCLK.
TRC	F2		Toggle rate control. Synchronous to rising edge and falling edge of DCLK.
DAD_BUS	B15		Reset control serial bus. Synchronous to rising edge of SAC_CLK.
RESET_OEZ	C15		Active low. Output enable signal for internal reset driver circuitry.
RESET_STROBE	B13		Rising edge on RESET_STROBE latches in the control signals.
SAC_BUS	A15		Stepped address control serial bus. Synchronous to rising edge of SAC_CLK.
SAC_CLK	A14		Stepped address control clock.
TCK	F15		JTAG clock.
TDI	E13		JTAG data input. Synchronous to rising edge of TCK. Bond pad connects to internal pull up resistor.
TDO	G15	LVCMOS output	JTAG data output. Synchronous to falling edge of TCK. Tri-state fail-safe output buffer.
TMS	G14	LVCMOS input	JTAG mode select. Synchronous to rising edge of TCK. Bond pad connects to internal pull up resistor.
TEMP_MINUS	G13	Analog input	Calibrated temperature diode used to assist accurate temperature measurements of DMD die.
TEMP_PLUS	G2		
V _{BIAS}	D15	Power	Power supply for positive bias level of mirror reset signal.
V _{CC}	A5, B12, C14, D12, F13, G3		Power supply for low voltage CMOS logic. Power supply for normal high voltage at mirror address electrodes. Power supply for offset level of mirror reset signal during power down.
V _{OFFSET}	E14	Power	Power supply for high voltage CMOS logic. Power supply for stepped high voltage at mirror address electrodes. Power supply for offset level of mirror reset signal.
V _{REF}	E15		Power supply for low voltage CMOS DDR interface.
V _{RESET}	D14		Power supply for negative reset level of mirror reset signal.
V _{SS}	A3, A13, B14, C4, C12, C13, D13, E3, E5, E12, F12, F14, G4, G12		Common return for all power.

表 5-1. Pin Functions (continued)

PIN		TYPE	DESCRIPTION
NAME	NO.		
RESERVED	A1, A12, A16,B1, B16, F1, F16, G1, G5, G16	Reserved	Do not connect.

6 Specifications

6.1 Absolute Maximum Ratings

See (2)

		MIN	MAX	UNIT
SUPPLY VOLTAGE⁽¹⁾				
V _{REF}	LVC MOS logic supply voltage	- 0.5	4	V
V _{CC}	LVC MOS logic supply voltage	- 0.5	4	V
V _{OFFSET}	Mirror electrode and HVC MOS voltage	- 0.5	8.75	V
V _{BIAS}	Mirror electrode voltage	- 0.5	17	V
V _{BIAS} - V _{OFFSET}	Supply voltage delta ⁽³⁾		8.75	V
V _{RESET}	Mirror electrode voltage	- 11	0.5	V
Input voltage: other inputs		- 0.5	V _{REF} + 0.3	V
f _{DCLK}	Clock frequency	60	82	MHz
I _{TEMP_DIODE}	Temperature diode current		500	μA
ENVIRONMENTAL				
T _{ARRAY}	Operating DMD array temperature ⁽⁴⁾	- 40	105	°C

(1) All voltage values are with respect to the ground pins (V_{SS}).

(2) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. Unless otherwise indicated, these are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

(3) To prevent excess current, the supply voltage delta |V_{BIAS} - V_{OFFSET}| must be less than or equal to 8.75 V.

(4) See 节 7.6.

6.2 Storage Conditions

Applicable for the DMD as a component or non-operating in a system. The device is not designed to be exposed to corrosive environments.

		MIN	MAX	UNIT
T _{stg}	DMD storage temperature	- 40	125	°C

6.3 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	All Pins	±2000
		Charged-device model (CDM) per AEC Q100-011	All Pins	±750
			Corner Pins ⁽²⁾	±750

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

(2) Corner pins are A1, G1, A16, and G16.

6.4 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
SUPPLY VOLTAGE RANGE					
V _{REF}	LVC MOS interface power supply voltage	1.65	1.8	1.95	V
V _{CC}	LVC MOS logic power supply voltage	2.25	2.5	2.75	V
V _{OFFSET}	Mirror electrode and HVCMOS voltage	8.25	8.5	8.75	V
V _{BIAS}	Mirror electrode voltage	15.5	16	16.5	V
V _{BIAS} - V _{OFFSET}	Supply voltage delta ⁽²⁾			8.75	V
V _{RESET}	Mirror electrode voltage	- 9.5	- 10	- 10.5	V
V _p VT+	Positive going threshold voltage	0.4 × V _{REF}		0.7 × V _{REF}	V
V _n VT-	Negative going threshold voltage	0.3 × V _{REF}		0.6 × V _{REF}	V
V _H ΔVT	Hysteresis voltage (V _p - V _n)	0.1 × V _{REF}		0.4 × V _{REF}	V
I _{OH_TDO}	High level output current @ V _{oh} = 2.25 V, TDO, V _{cc} = 2.25 V			- 2	mA
I _{OL_TDO}	Low level output current @ V _{ol} = 0.4 V, TDO, V _{cc} = 2.25 V			2	mA
TEMPERATURE DIODE					
I _{TEMP_DIODE}	Max current source into temperature diode ⁽⁴⁾			120	μA
ENVIRONMENTAL					
T _{ARRAY} ⁽⁵⁾	Operating DMD array temperature - steady state ⁽¹⁾	- 40		105	°C
ILL _{UV} ⁽³⁾	Illumination, wavelength < 395 nm			2.0	mW/cm ²
ILL _{OVERFILL}	Illumination overfill maximum heat load in area shown in 图 6-1 ⁽⁶⁾		T _{ARRAY} ≤ 75°C	26	mW/mm ²
ILL _{OVERFILL}	Illumination overfill maximum heat load in area shown in 图 6-1 ⁽⁶⁾		T _{ARRAY} > 75°C	20	

- (1) DMD active array temperature can be calculated as shown in 节 7.6 and assumes uniform illumination across the array.
- (2) To prevent excess current, the supply voltage delta |V_{BIAS} - V_{OFFSET}| must be less than or equal to 8.75 V.
- (3) The maximum operation conditions for DMD array temperature and illumination UV shall not be implemented simultaneously.
- (4) Temperature diode is to assist in the calculation of the DMD array temperature during operation.
- (5) Operating profile information for device micromirror landed duty-cycle and temperature may be provided if requested.
- (6) The active area of the DLP3020-Q1 device is surrounded by an aperture on the inside of the DMD window surface that masks structures of the DMD device assembly from normal view. The aperture is sized to anticipate several optical conditions. Overfill light illuminating the area outside the active array can scatter and create adverse effects to the performance of an end application using the DMD. The illumination optical system should be designed to minimize light flux incident outside the active array. Depending on the particular system's optical architecture and assembly tolerances, the amount of overfill light on the outside of the active array may cause system performance degradation. Overfill illumination in excess of this specification may also impact thermal performance.

图 6-1. Illumination Overfill Diagram

6.5 Thermal Information

THERMAL METRIC ⁽¹⁾		DLP3020-Q1	UNIT
		FQR (LGA)	
		64 PINS	
Thermal resistance	Active area to test point 1 (TP1) ⁽¹⁾	7.0	°C/W

- (1) The DMD is designed to conduct absorbed and dissipated heat to the back of the package. The cooling system must be capable of maintaining the package within the temperature range specified in 节 6.4. The total heat load on the DMD is largely driven by the incident light absorbed by the active area, although other contributions include light energy absorbed by the window aperture and electrical power dissipation of the array. Optical systems should be designed to minimize the light energy falling outside the window clear aperture since any additional thermal load in this area can significantly degrade the reliability of the device.

6.6 Electrical Characteristics

Over operating free-air temperature range (unless otherwise noted)⁽²⁾

PARAMETER		TEST CONDITIONS ⁽¹⁾	MIN	TYP	MAX	UNIT
V _{OH}	High level output voltage	V _{CC} = 2.25 V I _{OH} = - 8 mA	1.7			V

6.10 Physical Characteristics of the Micromirror Array

PARAMETER		VALUE	UNIT	
N	Number of active columns	See 图 6-7	684	micromirrors
M	Number of active rows	See 图 6-7	608	micromirrors
ϵ	Micromirror (pixel) pitch - diagonal	See 图 6-8	7.6	μm
P	Micromirror (pixel) pitch - horizontal and vertical	See 图 6-8	10.8	μm
	Micromirror active array width	$P \times M + P / 2$; see 图 6-7	6.5718	mm
	Micromirror active array height	$(P \times N) / 2 + P / 2$; see 图 6-7	3.699	mm
	Micromirror active border	Pond of micromirror (POM) ⁽¹⁾	10	micromirrors/side

- (1) The structure and qualities of the border around the active array includes a band of partially functional micromirrors called the POM. These micromirrors are structurally and/or electrically prevented from tilting toward the bright or ON state, but still require an electrical bias to tilt toward OFF.

图 6-7. Micromirror Array Physical Characteristics

图 6-8. Mirror (Pixel) Pitch

6.11 Micromirror Array Optical Characteristics

表 6-1. Optical Parameters

PARAMETER	MIN	NOM	MAX	UNIT
Micromirror tilt angle, landed (on-state or off-state) ⁽¹⁾		12		°
Micromirror tilt angle tolerance ⁽¹⁾	- 1		1	°
DMD efficiency, 420 nm - 680 nm ⁽²⁾		66%		

- (1) For some applications, it is critical to account for the micromirror tilt angle variation in the overall optical system design. With some optical system designs, the micromirror tilt angle variation within a device may result in perceivable non-uniformities in the light field reflected from the micromirror array. With some optical system designs, the micromirror tilt angle variation between devices may result in colorimetry variations, system efficiency variations, or system contrast variations.
- (2) DMD efficiency is measured photopically under the following conditions: 24° illumination angle, F/2.4 illumination and collection apertures, uniform source spectrum (halogen), uniform pupil illumination, the optical system is telecentric at the DMD, and the efficiency numbers are measured with 100% electronic mirror duty cycle and do not include system optical efficiency or overfill loss. Note that this number is measured under conditions described above and deviations from these specified conditions could result in a different efficiency value in a different optical system. The factors that can influence the DMD efficiency related to system application include: light source spectral distribution and diffraction efficiency at those wavelengths (especially with discrete light sources such as LEDs or lasers), and illumination and collection apertures (F/#) and diffraction efficiency. The interaction of these system factors as well as the DMD efficiency factors that are not system dependent are described in detail in [DMD Optical Efficiency for Visible Wavelengths](#).

6.12 Window Characteristics

PARAMETER		MIN	NOM	MAX	UNIT
Window material designation		Corning Eagle XG			
Window refractive index	at wavelength 546.1 nm	1.5119			
Window aperture ⁽¹⁾		See ⁽¹⁾			

(1) See the package mechanical ICD for details regarding the size and location of the window aperture.

6.13 Chipset Component Usage Specification

The DLP3020-Q1 DMD is a component of a DLP® chipset including a DLP products controller. Reliable function and operation of the DMD requires that it be used in conjunction with a DLP products controller.

备注

TI assumes no responsibility for image quality artifacts or DMD failures caused by optical system operating conditions exceeding limits described previously

7 Detailed Description

7.1 Overview

The DLP3020-Q1 DMD has a resolution of 608 × 684 mirrors configured in a diamond format that results in an aspect ratio of 16:9 which creates an effective resolution of 864 × 480 square pixels. By configuring the pixels in a diamond format, the illumination input to the DMD enters from the side allowing for smaller mechanical packaging of the optical system.

7.2 Functional Block Diagram

7.3 Feature Description

To ensure reliable operation, the DLP3020-Q1 DMD must be used with a DLP products controller.

7.3.1 Micromirror Array

The DLP3020-Q1 DMD consists of a two-dimensional array of 1-bit CMOS memory cells that determine the state of each of the 608 × 684 micromirrors in the array. Refer to [节 6.10](#) for a calculation of how the 608 × 684 micromirror array represents a 16:9 dimensional aspect ratio to the user. Each micromirror is either “ON” (tilted +12°) or “OFF” (tilted - 12°). Combined with appropriate projection optical system the DMD can be used to create sharp, colorful, and vivid digital images.

7.3.2 Double Data Rate (DDR) Interface

Each DMD micromirror and its associated SRAM memory cell is loaded with data from the DLP controller via the DDR interface (DATA(14:0), DCLK, LOADB, SCRTL, and TRC). These signals are low voltage CMOS nominally operating at 1.8-V level to reduce power and switching noise. This high speed data input to the DMD allows for a maximum update rate of the entire micromirror array to be nearly 5 kHz, enabling the creation of seamless digital images using Pulse Width Modulation (PWM).

7.3.3 Micromirror Switching Control

Once data is loaded onto the DMD, the mirrors switch position (+12° or - 12°) based on the timing signal sent to the DMD Mirror and SRAM control logic. The DMD mirrors will be switched from OFF to ON or ON to OFF, or stay in the same position based on control signals DAD_BUS, RESET_STROBE, SAC_BUS, and SAC_CLK, which are coordinated with the data loading by the DLP controller. In general, the DLP controller loads the DMD SRAM memory cells over the DDR interface, and then commands to the micromirrors to switch position.

At power down, the DMD Mirrors are commanded by the DLP controller to move to a near flat (0°) position as shown in [节 9](#). The flat state position of the DMD mirrors are referred to as the “Parked” state. To maintain long-term DMD reliability, the DMD must be properly “Parked” prior to every power down of the DMD power supplies.

7.3.4 DMD Voltage Supplies

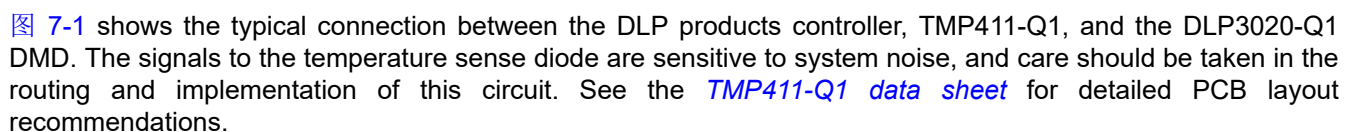

The micromirrors switching requires unique voltage levels to control the mechanical switching. These voltages levels are nominally 16 V, 8.5 V, and - 10 V (V_{BIAS} , V_{OFFSET} , and V_{RESET}). The specification values for V_{BIAS} , V_{OFFSET} , and V_{RESET} are shown in [节 6.4](#).

7.3.5 Logic Reset

Reset of the DMD is required and controlled by the DLP products controller.

7.3.6 Temperature Sensing Diode

The DMD includes a temperature sensing diode designed to be used with the TMP411-Q1 temperature monitoring device. The DLP products controller may monitor the DMD array temperature via the TMP411-Q1 and temperature sense diode.

 [图 7-1](#) shows the typical connection between the DLP products controller, TMP411-Q1, and the DLP3020-Q1 DMD. The signals to the temperature sense diode are sensitive to system noise, and care should be taken in the routing and implementation of this circuit. See the [TMP411-Q1 data sheet](#) for detailed PCB layout recommendations.

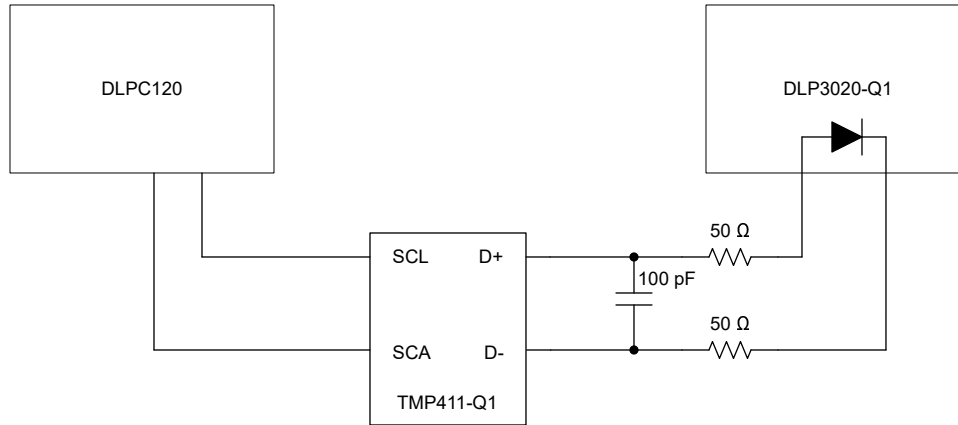

图 7-1. Temperature Sense Diode Typical Circuit Configuration

It is recommended that the host controller manage parking of the DMD based on the allowable temperature specifications and temperature measurements.

7.3.6.1 Temperature Sense Diode Theory

A temperature sensing diode is based on the fundamental current and temperature characteristics of a transistor. The diode is formed by connecting the transistor base to the collector. Two different known currents flow through the diode and the resulting diode voltage is measured in each case. The difference in the base-emitter voltages is proportional to the absolute temperature of the transistor.

Refer to the [TMP411-Q1 data sheet](#) for detailed information about temperature diode theory and measurement. 图 7-2 and 图 7-3 illustrate the relationship between the current and voltage through the diode.

图 7-2. Temperature Measurement Theory

图 7-3. Example of Delta VBE vs Temperature

7.3.7 DMD JTAG Interface

The DMD uses 4 standard JTAG signals for sending and receiving boundary scan test data. TCK is the test clock used to drive an IEEE 1149.1 TAP state machine and logic. TMS directs the next state of the TAP state machine. TDI is the scan data input and TDO is the scan data output.

The DMD does not support IEEE 1149.1 signals TRST (Test Logic Reset) and RTCK (Returned Test Clock). Boundary scan cells on the DMD are Observe-Only. To initiate the JTAG boundary scan operation on the DMD, a minimum of 6 TCK clock cycles are required after TMS is set to logic high.

Refer to [图 7-4](#) for a JTAG system board routing example.

图 7-4. System Interface Connection to DLP Products Controller

The DMD Device ID can be read via the JTAG interface. The ID and 32-bit shift order is shown in [图 7-5](#).

图 7-5. DMD Device ID and 32-bit Shift Order

Refer to [图 7-6](#) for a JTAG boundary scan block diagram for the DMD. These show the pins and the scan order that are observed during the JTAG boundary scan.

图 7-6. JTAG Boundary Scan Path

Refer to [图 7-7](#) for a functional block diagram of the JTAG control logic.

7.4 System Optical Considerations

Optimizing system optical performance and image performance strongly relates to optical system design parameter trades. Although it is not possible to anticipate every conceivable application, projector image quality and optical performance is contingent on compliance to the optical system operating conditions described in the following sections.

7.4.1 Numerical Aperture and Stray Light Control

The angle defined by the numerical aperture of the illumination and projection optics at the DMD optical area should be the same. This angle should not exceed the nominal device mirror tilt angle unless appropriate apertures are added in the illumination and/or projection pupils to block flat-state and stray light from passing through the projection lens. The mirror tilt angle defines DMD capability to separate the "On" optical path from any other light path, including undesirable flat-state specular reflections from the DMD window, DMD border structures, or other system surfaces near the DMD such as prism or lens surfaces. If the numerical aperture exceeds the mirror tilt angle, or if the projection numerical aperture angle is more than two degrees larger than the illumination numerical aperture angle, contrast ratio can be reduced and objectionable artifacts in the image border and/or active area could occur.

7.4.2 Pupil Match

TI's optical and image quality specifications assume that the exit pupil of the illumination optics is nominally centered within two degrees of the entrance pupil of the projection optics. Misalignment of pupils can create objectionable artifacts in the image border and/or active area, which may require additional system apertures to control, especially if the numerical aperture of the system exceeds the pixel tilt angle.

7.4.3 Illumination Overfill and Alignment

Overfill light illuminating the area outside the active array can create artifacts from the mechanical features and other surfaces that surround the active array. These artifacts may be visible in the projected image. The illumination optical system should be designed to minimize light flux incident outside the active array and on the window aperture. Depending on the particular system's optical architecture and assembly tolerances, this amount of overfill light on the area outside of the active array may still cause artifacts to be visible. Illumination light and overfill can also induce undesirable thermal conditions on the DMD, especially if illumination light impinges directly on the DMD window aperture or near the edge of the DMD window. Refer to [节 6.4](#) for a specification on this maximum allowable heat load due to illumination overfill.

7.5 DMD Image Performance Specification

PARAMETER ⁽¹⁾	MIN	NOM	MAX	UNIT
Bright Pixels - Viewed on a linear gray 10 screen			0	micromirrors
Dark Pixels - Viewed on a white screen			4	micromirrors
Optical performance	See System Optical Considerations			

(1) Any artifact that is not specifically called out in this table is acceptable. Viewing distance must be > 60 in. Screen size should be similar to application image size. All values referenced are in linear gamma. Non-linear gamma curves may be running by default, and it should be ensured with a TI applications engineer that the equivalent linear gamma value as specified is used to judge artifacts.

7.6 Micromirror Array Temperature Calculation

Active array temperature can be computed analytically from measurement points on the outside of the package, the package thermal resistance, the electrical power, and the illumination heat load.

Relationship between array temperature and the reference ceramic temperature (thermocouple location TP1 in [图 7-8](#)) is provided by the following equations.

$$T_{\text{ARRAY}} = T_{\text{CERAMIC}} + (Q_{\text{ARRAY}} \times R_{\text{ARRAY-TO-CERAMIC}}) \quad (1)$$

$$Q_{\text{ARRAY}} = Q_{\text{ELECTRICAL}} + Q_{\text{ILLUMINATION}} \quad (2)$$

where

- T_{ARRAY} = computed DMD array temperature (°C)
- T_{CERAMIC} = measured ceramic temperature (TP1 location in [图 7-8](#)) (°C)
- $R_{\text{ARRAY-TO-CERAMIC}}$ = DMD package thermal resistance from array to TP1 (°C/watt) (see [节 6.5](#))
- Q_{ARRAY} = total power, electrical plus absorbed, on the DMD array (watts)
- $Q_{\text{ELECTRICAL}}$ = nominal electrical power dissipation by the DMD (watts)
- $Q_{\text{ILLUMINATION}} = (C_{\text{L2W}} \times S_{\text{L}})$
- C_{L2W} = conversion constant for screen lumens to power on the DMD (watts/lumen)
- S_{L} = measured screen lumens (lm)

Electrical power dissipation of the DMD is variable and depends on the voltages, data rates, and operating frequencies.

Absorbed power from the illumination source is variable and depends on the operating state of the mirrors and the intensity of the light source.

Equations shown previous are valid for a 1-Chip DMD system with total projection efficiency from DMD to the screen of 87%.

The constant C_{L2W} is based on the DMD array characteristics. It assumes a spectral efficiency of 300 lumens/watt for the projected light and illumination distribution of 83.7% on the active array, and 16.3% on the array border.

Sample calculation:

- $S_{\text{L}} = 50 \text{ lm}$
- $C_{\text{L2W}} = 0.00293 \text{ W/lm}$
- $Q_{\text{ELECTRICAL}} = 0.162 \text{ W}$
- $R_{\text{ARRAY-TO-CERAMIC}} = 7.0^\circ\text{C/W}$
- $T_{\text{CERAMIC}} = 55^\circ\text{C}$

$$Q_{\text{ARRAY}} = 0.162 \text{ W} + (0.00293 \times 50 \text{ lm}) = 0.309 \text{ W} \quad (3)$$

$$T_{\text{ARRAY}} = 55^\circ\text{C} + (0.309 \text{ W} \times 7.0^\circ\text{C/W}) = 57.2^\circ\text{C} \quad (4)$$

图 7-8. Thermocouple Location

7.7 Micromirror Landed-On/Landed-Off Duty Cycle

The micromirror landed-on/landed-off duty cycle (landed duty cycle) denotes the amount of time (as a percentage) that an individual micromirror is landed in the ON state versus the amount of time the same micromirror is landed in the OFF state.

As an example, assuming a fully-saturated white pixel, a landed duty cycle of 90/10 indicates that the referenced pixel is in the ON state 90% of the time (and in the OFF state 10% of the time), whereas 10/90 would indicate that the pixel is in the OFF state 90% of the time. Likewise, 50/50 indicates that the pixel is ON 50% of the time and OFF 50% of the time.

Note that when assessing landed duty cycle, the time spent switching from one state (ON or OFF) to the other state (OFF or ON) is considered negligible and is thus ignored.

Since a micromirror can only be landed in one state or the other (ON or OFF), the two numbers (percentages) always add to 100.

8 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The DLP3020-Q1 DMD was designed to be used in automotive applications such as head-up display (HUD).

The information shown in this section describes the HUD application based on the TI reference design. Contact TI application engineer for information on this design.

8.2 Typical Application

The DLP3020-Q1 DMD combined with the DLPC120-Q1 are the primary devices that make up the reference design for a HUD system as shown in the block diagram [图 8-1](#).

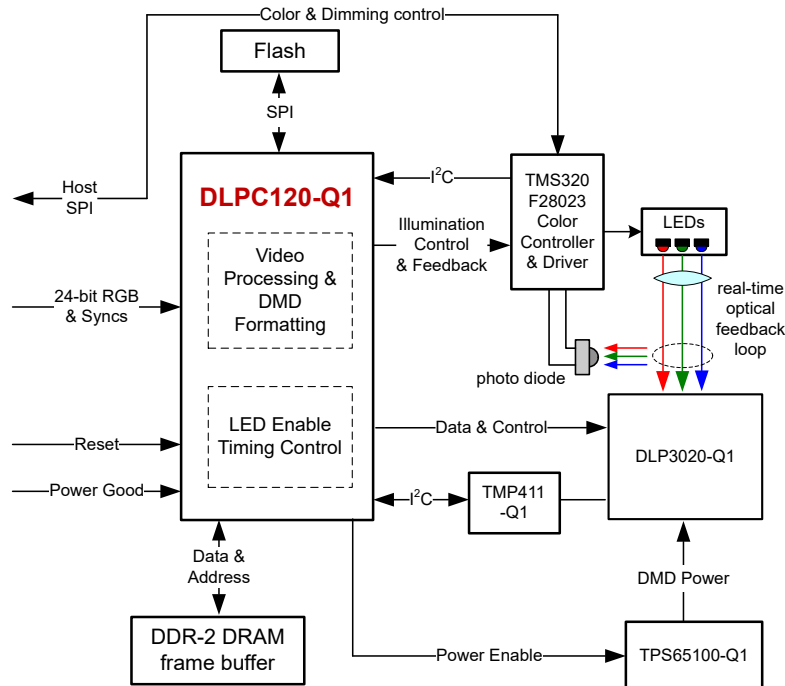

图 8-1. HUD Reference Design Block Diagram

The DLPC120-Q1 accepts input video over the parallel RGB data interface up to 8 bits per color from a video graphics processor. The DLPC120-Q1 then processes the video data (864×480 manhattan orientation) by scaling the image to match the DMD resolution (608×684 diamond pixel), applies de-gamma correction, bezel adjustment, and then formats the data into DMD bit plane information and stores the data into the DDR2 DRAM.

The DMD bit planes are read from DDR2 DRAM, and are then displayed on the DMD using pulse width modulation (PWM) timing. The DLPC120-Q1 synchronizes the DMD bit plane data with the RGB enable timing for the LED color controller and Driver circuit. Finally, the DMD accepts the bit plane formatted data from the DLPC120-Q1 and displays the data according to the timing controlled by the DLPC120-Q1.

Due to the mechanical nature of the micromirrors, the latency of the DLP3020-Q1 and DLPC120-Q1 chipset is fixed across all temperature and operating conditions. The observed video latency is one frame, or 16.67 ms at

an input frame rate of 60 Hz. However, please note that the use of the DLPC120-Q1 bezel adjustment feature, if enabled by the host controller, requires an additional frame of processing.

The DLPC120-Q1 is configured at power up by data stored in the flash file which stores configuration data, DMD and sequence timing information, LED drive information, and other information related to the system functions.

See the DLPC120-Q1 programmer's guide for information about the this flash configuration data.

The HUD reference design from TI includes the TMS320F28023 microcontroller (Piccolo) which is used to control the color point by adjusting the RGB flux levels, and drives each RGB LED. This circuit also manages the dimming function for the HUD system. The dimming level of a HUD system requires very large dynamic range of over 5000:1. For example, on a bright day, the HUD system may require a brightness level as high as 15,000 cd/m² and conversely at night time the minimum brightness level desired may only be 3 cd/m².

8.3 Application Mission Profile Consideration

Each application is anticipated to have different mission profiles, or number of operating hours at different temperatures. To assist in evaluation, the automotive DMD reliability lifetime estimates Application Report may be provided. See the TI Application team for more information.

9 Power Supply Recommendations

9.1 Power Supply Sequencing Requirements

- V_{BIAS} , V_{CC} , V_{OFFSET} , V_{REF} , V_{RESET} , V_{SS} are required to operate the DMD.

CAUTION

- For reliable operation of the DMD, the following power supply sequencing requirements must be followed. Failure to adhere to the prescribed power up and power down procedures may affect device reliability.
- The V_{CC} , V_{REF} , V_{OFFSET} , V_{BIAS} , and V_{RESET} power supplies have to be coordinated during power up and power down operations. Failure to meet any of the following requirements will result in a significant reduction in the DMD's reliability and lifetime. Refer to [图 9-1](#). V_{SS} must also be connected.

DMD Power Supply Power Up Procedure:

- During power up, V_{CC} and V_{REF} must always start and settle before V_{OFFSET} , V_{BIAS} and V_{RESET} voltages are applied to the DMD.
- During power up, V_{BIAS} does not have to start after V_{OFFSET} . However, it is a strict requirement that the delta between V_{BIAS} and V_{OFFSET} must be within ± 8.75 V (refer to Note 1 for [图 9-1](#)).
- During power up, the DMD's LVCMOS input pins shall not be driven high until after V_{CC} and V_{REF} have settled at operating voltage.
- During power up, there is no requirement for the relative timing of V_{RESET} with respect to V_{OFFSET} and V_{BIAS} .
- Power supply slew rates during power up are flexible, provided that the transient voltage levels follow the requirements listed previously in [节 6.4](#) and in [图 9-1](#).

DMD Power Supply Power Down Procedure

- V_{CC} and V_{REF} must be supplied until after V_{BIAS} , V_{RESET} , and V_{OFFSET} are discharged to within 4 V of ground.
- During power down it is not mandatory to stop driving V_{BIAS} prior to V_{OFFSET} , but it is a strict requirement that the delta between V_{BIAS} and V_{OFFSET} must be within ± 8.75 V (refer to Note 1 for [图 9-1](#)).
- During power down, the DMD's LVCMOS input pins must be less than $V_{REF} + 0.3$ V.
- During power down, there is no requirement for the relative timing of V_{RESET} with respect to V_{OFFSET} and V_{BIAS} .
- Power supply slew rates during power down are flexible, provided that the transient voltage levels follow the requirements listed previously in [节 6.4](#) and in [图 9-1](#).

9.1.1 Power Up and Power Down

Note 1: $\pm 8.75\text{-V}$ delta, ΔV , shall be considered the max operating delta between V_{BIAS} and V_{OFFSET}. Customers may find that the most reliable way to ensure this is to power V_{OFFSET} prior to V_{BIAS} during power up and to remove V_{BIAS} prior to V_{OFFSET} during power down.

图 9-1. Power Supply Sequencing Requirements (Power Up and Power Down)

10 Layout

10.1 Layout Guidelines

For specific DMD PCB guidelines, use the following:

- V_{CC} should have at least $1 \times 2.2\text{-}\mu\text{F}$ and $4 \times 0.1\text{-}\mu\text{F}$ capacitors evenly distributed among the V_{CC} pins.
- A $0.1\text{-}\mu\text{F}$, X7R rated capacitor should be placed near every pin for the V_{REF} , V_{BIAS} , V_{RSET} , and V_{OFF} .

10.2 Temperature Diode Pins

The DMD has an internal diode (PN junction) that is intended to be used with an external TI TMP411-Q1 temperature sensing IC. PCB traces from the DMD's temperature diode pins to the TMP411-Q1 are sensitive to noise. See the [TMP411-Q1 data sheet](#) for specific routing recommendations.

Avoid routing the temperature diodes signals near other traces to reduce coupling of noise onto these signals.

11 Device and Documentation Support

11.1 Device Support

11.1.1 Device Nomenclature

图 11-1. Part Number Description

11.1.2 Device Markings

The device marking is shown in 图 11-2. The marking will include both human-readable information and a 2-dimensional matrix code.

The human-readable information is described in 图 11-2. The 2-dimensional matrix code is an alpha-numeric character string that contains the DMD part number and lot trace code.

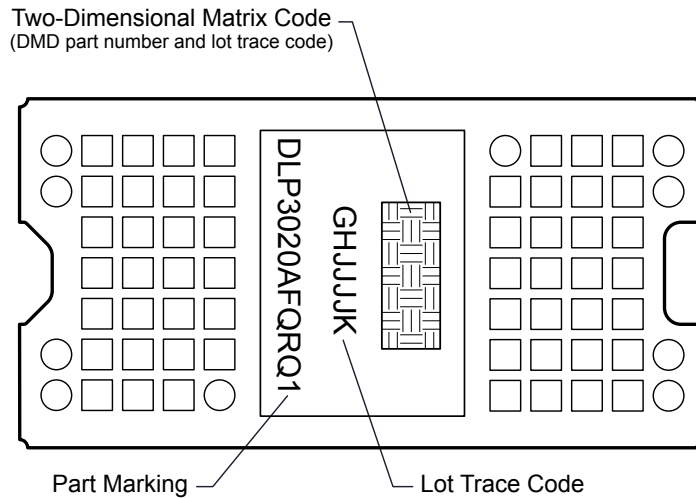

图 11-2. DMD Marking

11.2 Documentation Support

11.2.1 Related Documentation

For related documentation see the following:

11.3 接收文档更新通知

要接收文档更新通知，请导航至 ti.com 上的器件产品文件夹。点击 [订阅更新](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

11.4 支持资源

[TI E2E™ 支持论坛](#) 是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [《使用条款》](#)。

11.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.7 Device Handling

The DMD is an optical device so precautions should be taken to avoid damaging the glass window. Please see the [DMD Handling application note](#) for instructions on how to properly handle the DMD.

11.8 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DLP3020AFQRQ1	ACTIVE	CLGA	FQR	54	126	RoHS & Green	Call TI	N / A for Pkg Type	-40 to 105		Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
