

## LMK1D210x 低附加抖动 LVDS 缓冲器

### 1 特性

- 高性能 LVDS 时钟缓冲器系列：高达 2GHz
  - 双路 1:2 差分缓冲器
  - 双路 1:4 差分缓冲器
- 电源电压：1.71V 至 3.465V
- 失效防护输入操作
- 低附加抖动：156.25MHz 下时最大 RMS 抖动小于 60fs (12kHz 至 20MHz)
  - 超低相位本底噪声：-164dBc/Hz (典型值)
- 传播延迟极低，< 575ps (最大值)
- 输出偏移：20ps (最大值)
- 通用输入接受 LVDS、LVPECL、LVCMOS、HCSL 和 CML 信号电平。
- LVDS 基准电压， $V_{AC\_REF}$ ，适用于容性耦合输入
- 工业温度范围：-40°C 至 105°C
- 封装采用
  - LMK1D2102：3mm x 3mm 16 引脚 VQFN
  - LMK1D2104：5mm x 5mm，28 引脚 VQFN

### 2 应用

- 电信及网络
- 医疗成像
- 测试和测量
- 无线基础设施
- 专业音频、视频和标牌

### 3 说明

LMK1D210x 时钟缓冲器将两个时钟输入 (IN0 和 IN1) 分配给总共多达 8 对差分 LVDS 时钟输出 (OUT0、OUT7)，通过超小偏斜实现时钟分配每个缓冲器块由一个输入和最多 4 个 LVDS 输出组成。输入可以为 LVDS、LVPECL、HCSL、CML 或 LVCMOS。

LMK1D210x 专为驱动 50Ω 传输线路而设计。在以单端模式驱动输入的情况下，必须将图 8-6 中所示的适当偏置电压施加到未使用的负输入引脚。

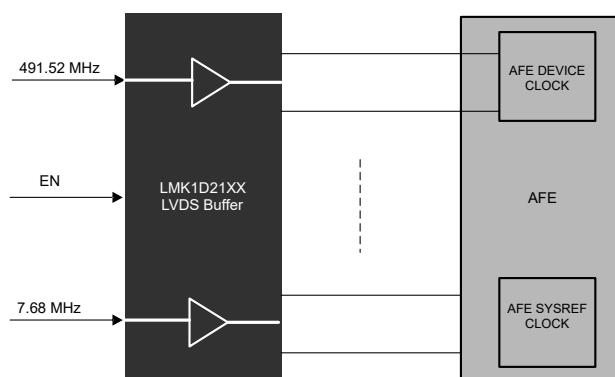

使用控制引脚 (EN) 可以启用或禁用输出组。如果此引脚保持开路，则包含所有输出的两个缓冲器将被启用，如果切换到逻辑“0”，则两个组以及所有输出将被禁用 (静态逻辑“0”)，如果切换到逻辑“1”，则一个组及其输出将被禁用，而另一个组及其输出将被启用。该器件支持失效防护功能。该器件还整合了输入迟滞，可防止在没有输入信号的情况下输出随机振荡。

该器件可在 1.8V、2.5V 或 3.3V 电源环境下工作，温度范围是 -40°C 至 105°C (环境温度)。下表中显示了 LMK1D210x 封装类型：

器件信息

| 器件型号 <sup>(1)</sup> | 封装        | 封装尺寸 (标称值)      |
|---------------------|-----------|-----------------|
| LMK1D2102           | VQFN (16) | 3.00mm × 3.00mm |
| LMK1D2104           | VQFN (28) | 5.00mm × 5.00mm |

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

应用示例

表 5-1. Pin Functions

| NAME   | PIN       |           | TYPE <sup>(1)</sup> | DESCRIPTION   |
|--|-----------|-----------|---------------------|---|
|  | LMK1D2102 | LMK1D2104 |                     |   |
| <b>DIFFERENTIAL/SINGLE-ENDED CLOCK INPUT</b> |           |           |                     |   |
| IN0_P, IN0_N                                 | 6, 7      | 9, 10     | I                   | Primary: Differential input pair or single-ended input  |
| IN1_P, IN1_N                                 | 3, 4      | 5, 6      | I                   | Secondary: Differential input pair or single-ended input.<br>Note that INP0, INN0 are used indistinguishably with IN0_P, IN0_N. |
| <b>OUTPUT BANK CONTROL</b>                   |           |           |                     |   |
| EN   | 2         | 4         | I                   | Output bank enable/disable with an internal 500-k $\Omega$ pullup and 320-k $\Omega$ pulldown, selects input port; (See 表 8-1)  |
| <b>BIAS VOLTAGE OUTPUT</b>                   |           |           |                     |   |
| V <sub>AC_REF0</sub> , V <sub>AC_REF1</sub>  | 8         | 11, 7     | O                   | Bias voltage output for capacitive coupled inputs. If used, TI recommends using a 0.1- $\mu$ F capacitor to GND on this pin.    |
| <b>DIFFERENTIAL CLOCK OUTPUT</b>             |           |           |                     |   |
| OUT0_P, OUT0_N                               | 9, 10     | 12, 13    | O                   | Differential LVDS output pair number 0  |
| OUT1_P, OUT1_N                               | 11, 12    | 16, 17    | O                   | Differential LVDS output pair number 1  |
| OUT2_P, OUT2_N                               | 13, 14    | 18, 19    | O                   | Differential LVDS output pair number 2  |
| OUT3_P, OUT3_N                               | 15, 16    | 20, 21    | O                   | Differential LVDS output pair number 3  |
| OUT4_P, OUT4_N                               |           | 22, 23    | O                   | Differential LVDS output pair number 4  |
| OUT5_P, OUT5_N                               |           | 24, 25    | O                   | Differential LVDS output pair number 5  |
| OUT6_P, OUT6_N                               |           | 26, 27    | O                   | Differential LVDS output pair number 6  |
| OUT7_P, OUT7_N                               |           | 2, 3      | O                   | Differential LVDS output pair number 7  |
| <b>SUPPLY VOLTAGE</b>                        |           |           |                     |   |
| V <sub>DD</sub>                              | 5         | 8, 15, 28 | P                   | Device Power Supply (1.8V or 2.5V or 3.3V)  |
| <b>GROUND</b>                                |           |           |                     |   |
| GND  | 1         | 1, 14     | G                   | Ground  |
| DAP  | DAP       | DAP       | G                   | Die Attach Pad. Connect to the PCB ground plane for heat dissipation.   |

(1) G = Ground, I = Input, O = Output, P = Power

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                  |                                    | MIN   | MAX                   | UNIT |
|------------------|------------------------------------|-------|-----------------------|------|
| V <sub>DD</sub>  | Supply voltage                     | - 0.3 | 3.6                   | V    |
| V <sub>IN</sub>  | Input voltage                      | - 0.3 | 3.6                   | V    |
| V <sub>O</sub>   | Output voltage                     | - 0.3 | V <sub>DD</sub> + 0.3 | V    |
| I <sub>IN</sub>  | Input current                      | - 20  | 20                    | mA   |
| I <sub>O</sub>   | Continuous output current          | - 50  | 50                    | mA   |
| T <sub>J</sub>   | Junction temperature               |       | 135                   | °C   |
| T <sub>stg</sub> | Storage temperature <sup>(2)</sup> | - 65  | 150                   | °C   |

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) Device unpowered

### 6.2 ESD Ratings

|                    |                         |  | VALUE | UNIT |
|--------------------|-------------------------|--|-------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>              | ±3000 | V    |
|                    |                         | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup> | ±1000 |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                 |                                |  | MIN   | NOM | MAX   | UNIT |
|-----------------|--------------------------------|--|-------|-----|-------|------|
| V <sub>DD</sub> | Core supply voltage            | 3.3-V supply   | 3.135 | 3.3 | 3.465 | V    |
|                 |                                | 2.5-V supply   | 2.375 | 2.5 | 2.625 |      |
|                 |                                | 1.8-V supply   | 1.71  | 1.8 | 1.89  |      |
| Supply Ramp     | Supply voltage ramp            | Requires monotonic ramp (10-90% of V <sub>DD</sub> ) | 0.1   |     | 20    | ms   |
| T <sub>A</sub>  | Operating free-air temperature |  | - 40  |     | 105   | °C   |
| T <sub>J</sub>  | Operating junction temperature |  | - 40  |     | 135   | °C   |

## 6.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |  | LMK1D2102 | LMK1D2104 | UNIT |
|-------------------------------|--|-----------|-----------|------|
|                               |  | VQFN      | VQFN      |      |
|                               |  | 16 PINS   | 28 PINS   |      |
| $R_{\theta JA}$               | Junction-to-ambient thermal resistance       | 48.7      | 38.9      | °C/W |
| $R_{\theta JC(top)}$          | Junction-to-case (top) thermal resistance    | 56.4      | 32.1      | °C/W |
| $R_{\theta JB}$               | Junction-to-board thermal resistance         | 23.6      | 18.7      | °C/W |
| $\Psi_{JT}$                   | Junction-to-top characterization parameter   | 1.6       | 1         | °C/W |
| $\Psi_{JB}$                   | Junction-to-board characterization parameter | 23.6      | 18.7      | °C/W |
| $R_{\theta JC(bot)}$          | Junction-to-case (bottom) thermal resistance | 8.6       | 8.2       | °C/W |

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

VDD = 1.8 V ± 5%, -40 °C ≤ T<sub>A</sub> ≤ 105 °C. Typical values are at VDD = 1.8 V, 25 °C (unless otherwise noted)

| PARAMETER   |   | TEST CONDITIONS  | MIN                 | TYP                 | MAX                   | UNIT            |

- (1) Measured between single-ended/differential input crossing point to the differential output crossing point.
- (2) For the dual bank devices, the inputs are phase aligned and have 50% duty cycle.
- (3) Defined as the magnitude of the time difference between the high-to-low and low-to-high propagation delay times at an output.

## 6.6 Typical Characteristics

The [图 6-1](#) captures the variation of the LMK1D2104 current consumption with input frequency and supply voltage. The LMK1D2102 follows a similar trend. [图 6-2](#) shows the variation of the differential output voltage (VOD) swept across frequency. This result is applicable to LMK1D2102 as well.

It is important to note that [图 6-1](#) and [图 6-2](#) serve as a guidance to the users on what to expect for the range of operating frequency supported by LMK1D210x. It is crucial to note that these graphs were plotted for a limited number of frequencies and load conditions which may not represent the customer system.

## 8 Detailed Description

### 8.1 Overview

The LMK1D210x LVDS drivers use CMOS transistors to control the output current. Therefore, proper biasing and termination are required to ensure correct operation of the device and to maximize signal integrity.

The proper LVDS termination for signal integrity over two 50- $\Omega$  lines is 100  $\Omega$  between the outputs on the receiver end. Either DC-coupled termination or AC-coupled termination can be used for LVDS outputs. TI recommends placing a termination resistor close to the receiver. If the receiver is internally biased to a voltage different than the output common-mode voltage of the LMK1D210x, AC-coupling must be used. If the LVDS receiver has internal 100- $\Omega$  termination, external termination must be omitted.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

The LMK1D210x is a low additive jitter LVDS fan-out buffer that can generate up to four copies of a single input which can be either LVPECL, LVDS, or LVCMOS on each of its banks. Since the device has two banks, this translates to a total of eight pairs of outputs (LMK1D2104). The reference clock frequencies can go up to 2 GHz.

Apart from providing a very low additive jitter and low output skew, the LMK1D210x has a control pin (EN), which controls the enabling/disabling of the output banks.

#### 8.3.1 Fail-Safe Inputs

The LMK1D210x family of devices is designed to support fail-safe input operation. This feature allows the user to drive the device inputs before VDD is applied without damaging the device. Refer to [节 6.1](#) for more information on the maximum input supported by the device. The device also incorporates an input hysteresis that prevents random oscillation in absence of an input signal, allowing the input pins to be left open.

### 8.4 Device Functional Modes

The output banks of the LMK1D210x can be selected through the control pin (see [表 8-1](#)). Unused inputs and outputs can be left floating to reduce overall component cost. Both AC- and DC-coupling schemes can be used with the LMK1D210x to provide greater system flexibility.

表 8-1. Output Control Table

| EN   | CLOCK OUTPUTS  |
|------|--|
| 0    | All outputs disabled (static "0")  |
| 1    | OUT0, OUT1... OUT[(N/2)-1] enabled and OUT[(N/2)⋯OUT[-1]] disabled. Example: LMK1D2102 (OUT0, OUT1 enabled, OUT2, OUT3 disabled) |
| Open | All outputs enabled  |

### 8.4.1 LVDS Output Termination

TI recommends unused outputs to be terminated differentially with a 100-Ω resistor for optimum performance, although unterminated outputs are also okay but will result in slight degradation in performance (Output AC common-mode  $V_{OS}$ ) in the outputs being used.

The LMK1D210x can be connected to LVDS receiver inputs with DC- and AC-coupling as shown in 图 8-1 and 图 8-2 (respectively).

图 8-1. Output DC Termination

图 8-2. Output AC Termination (With the Receiver Internally Biased)

### 8.4.2 Input Termination

The LMK1D210x inputs can be interfaced with LVDS, LVPECL, HCSL or LVCMOS drivers.

LVDS drivers can be connected to LMK1D210x inputs with DC- and AC-coupling as shown 图 8-3 and 图 8-4 (respectively).

图 8-3. LVDS Clock Driver Connected to LMK1D210x Input (DC-Coupled)

图 8-4. LVDS Clock Driver Connected to LMK1D210x Input (AC-Coupled)

图 8-5 shows how to connect LVPECL inputs to the LMK1D210x. The series resistors are required to reduce the LVPECL signal swing if the signal swing is >1.6 V<sub>pp</sub>.

图 8-5. LVPECL Clock Driver Connected to LMK1D210x Input

图 8-6 illustrates how to couple a LVCMOS clock input to the LMK1D210x directly.

图 8-6. 1.8-V/2.5-V/3.3-V LVCMOS Clock Driver Connected to LMK1D210x Input

Unused inputs can be left floating thus reducing the need for additional components.

## 9 Application and Implementation

### 备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The LMK1D210x is a low additive jitter universal to LVDS fan-out buffer with dual inputs which fan-out to dual outputs banks. Each input can fan-out to a maximum of four outputs (LMK1D2104). The small package, 1.8 V power supply operation, low output skew, and low additive jitter makes this device suitable for applications that require high performance clock distribution as well as for low power and space constraint applications.

### 9.2 Typical Application

图 9-1. Fan-Out Buffer for ADC Device clock and SYSREF distribution

#### 9.2.1 Design Requirements

The LMK1D210x shown in 图 9-1 is configured to fan-out an ADC clock on the first output bank and SYSREF clock on the second output bank for a system utilizing the JESD204B/C ADC. The low output to output skew, very low additive jitter and superior spurious suppression between dual banks makes the LMK1D210x a simple, robust and low-cost solution for distributing various clocks to JESD204B/C AFE systems. The configuration example can drive up to 4 ADC clocks and 4 SYSREF clocks for a JESD204B/C receiver with the following properties:

- The ADC clock receiver module is typically AC coupled with an LVDS driver such as the LMK1D210x due to differences in common-mode between the driver and receiver. Depending on the receiver, there may be an option for internal 100- $\Omega$  differential termination in which case an external termination would not be required for the LMK1D210x.
- The SYSREF clock receiver module is typically DC coupled provided the common-mode voltage of the LMK1D210x outputs match with the receiver. An external termination may not be needed in case of an internal termination in the receiver.
- Unused outputs of the LMK1D device are terminated differentially with a 100- $\Omega$  resistor for optimum performance.

#### 9.2.2 Detailed Design Procedure

See 节 8.4.2 for proper input terminations, dependent on single-ended or differential inputs.

See 节 8.4.1 for output termination schemes depending on the receiver application.

TI recommends unused outputs to be terminated differentially with a 100-Ω resistor for optimum performance, although unterminated outputs are also okay but will result in slight degradation in performance (Output AC common-mode  $V_{OS}$ ) in the outputs being used.

In the application example described in the previous section [图 9-1](#), the ADC clock and SYSREF clocks require different output interfacing schemes. Power supply filtering and bypassing is critical for low-noise applications.

In case of common-mode mismatch between the output voltage of the LMK1D210x and the receiver, one can use AC coupling to get around this, however, in certain applications, it might not be possible to AC couple the LMK1D210x outputs to the receiver due to the settling time associated with this AC coupling network (High-pass filter) which can result in non-deterministic behavior during the initial transients. For such applications, it becomes necessary to DC couple the outputs and thus requires a scheme which can overcome the inherent mismatch between the common-mode of the driver and receiver.

The application report [Interfacing LVDS Driver With a Sub-LVDS Receiver](#) discusses how to interface between a LVDS driver and sub-LVDS receiver. Same concept can be applied to interface the LMK1D210x outputs to a receiver which has lower common-mode.

**图 9-2. Schematic for DC coupling LMK1D21xx with lower common-mode receiver**

The [图 9-2](#) illustrates the resistor divider network for stepping down the common mode as explained in the above application report. The resistors R1, R2 and R3 are chosen according to the input common mode requirements of the receiver. As highlighted before, user needs to make sure that the reduced swing is able to meet the requirements of the receiver.

### 9.2.3 Application Curves

The LMK1D2104's low additive noise is shown below. The low noise 156.25-MHz source with 24-fs RMS jitter shown in [图 9-3](#) drives the LMK1D2104, resulting in 46.4-fs RMS when integrated from 12 kHz to 20 MHz ([图 9-4](#)). The resultant additive jitter is a low 39.7-fs RMS for this configuration. Note that this result applies to the LMK1D2102 device as well.

A. Reference signal is low-noise Rohde and Schwarz SMA100B

**图 9-3. LMK1D2104 Reference Phase Noise, 156.25 MHz, 24-fs RMS (12 kHz to 20 MHz)**

**图 9-4. LMK1D2104 Output Phase Noise, 156.25 MHz, 46.4-fs RMS (12 kHz to 20 MHz)**

The  9-5 captures the low close-in phase noise of the LMK1D2104 device. The LMK1D2102 and LMK1D2104 have excellent flicker noise as a result of superior process technology and design. This enables their use for clock distribution in radar systems, medical imaging systems etc which require ultra-low close-in phase noise clocks.

 9-5. LMK1D2104 Output Phase Noise, 100 MHz, 1 kHz offset: -147 dBc/Hz

## 10 Power Supply Recommendations

High-performance clock buffers are sensitive to noise on the power supply, which can dramatically increase the additive jitter of the buffer. Thus, it is essential to reduce noise from the system power supply, especially when jitter or phase noise is critical to applications.

Filter capacitors are used to eliminate the low-frequency noise from the power supply, where the bypass capacitors provide the low impedance path for high-frequency noise and guard the power-supply system against the induced fluctuations. These bypass capacitors also provide instantaneous current surges as required by the device and must have low equivalent series resistance (ESR). To properly use the bypass capacitors, they must be placed close to the power-supply pins and laid out with short loops to minimize inductance. TI recommends adding as many high-frequency (for example, 0.1- $\mu\text{F}$ ) bypass capacitors as there are supply pins in the package. TI recommends, but does not require, inserting a ferrite bead between the board power supply and the chip power supply that isolates the high-frequency switching noises generated by the clock driver; these beads prevent the switching noise from leaking into the board supply. Choose an appropriate ferrite bead with low DC-resistance because it is imperative to provide adequate isolation between the board supply and the chip supply, as well as to maintain a voltage at the supply pins that is greater than the minimum voltage required for proper operation.

图 10-1 shows this recommended power-supply decoupling method.

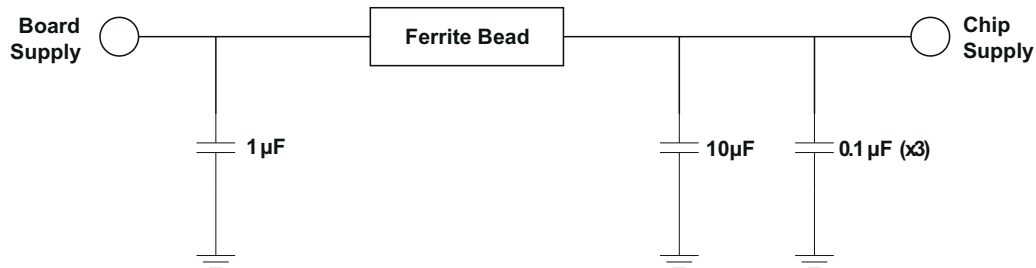

图 10-1. Power Supply Decoupling

## 11 Layout

### 11.1 Layout Guidelines

For reliability and performance reasons, the die temperature must be limited to a maximum of 135°C.

The device package has an exposed pad that provides the primary heat removal path to the printed-circuit board (PCB). To maximize the heat dissipation from the package, a thermal landing pattern including multiple vias to a ground plane must be incorporated into the PCB within the footprint of the package. The thermal pad must be soldered down to ensure adequate heat conduction to of the package. 图 11-1 shows a recommended land and via pattern for the 16-pin package (LMK1D2102).

### 11.2 Layout Example

### 12.2 接收文档更新通知

要接收文档更新通知，请导航至 [ti.com](https://www.ti.com) 上的器件产品文件夹。点击 [订阅更新](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

### 12.3 支持资源

[TI E2E™ 支持论坛](#) 是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [《使用条款》](#)。

### 12.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

### 12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 12.6 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
