

# 具有可配置电压转换、三态输出和总线保持输入的 SN74LXCH1T45 1 位双电源总线收发器

## 1 特性

- 完全可配置的双电源轨设计允许各个端口在 1.1V 至 5.5V 范围内运行
- 稳健、无干扰电源时序控制
- 在 3.3V 至 5.0V 范围内，支持高达 420 Mbps 的速率
- 总线保持数据输入消除了对外部上拉或下拉电阻器的需求
- 施密特触发控制输入可实现慢速或高噪声输入
- 带集成静态下拉电阻器的控制输入允许浮动控制输入
- 高驱动强度 (在 5V 时最高达 32 mA)
- 低功耗
  - 最大值 3 $\mu$ A (25 $^{\circ}$ C)
  - 最大值 6 $\mu$ A ( - 40 $^{\circ}$ C 至 125 $^{\circ}$ C )
- $V_{CC}$  隔离和  $V_{CC}$  断开特性
  - 如果任何一个  $V_{CC}$  电源低于 100 mV，则所有 I/O 均变为高阻抗状态
  - $I_{off-float}$  支持  $V_{CC}$  断开操作
- $I_{off}$  支持局部断电模式运行
- 兼容 LVC 系列电平转换器
- 控制逻辑 (DIR) 以  $V_{CCA}$  为基准
- 工作温度范围为 - 40 $^{\circ}$ C 至 +125 $^{\circ}$ C
- 闩锁性能超过 100 mA，符合 JESD 78 II 类规范
- ESD 保护性能超过 JESD 22 规范要求
  - 4000V 人体放电模型
  - 1000V 充电器件模型

## 2 应用

- 消除缓慢或嘈杂输入信号
- 驱动指示 LED 或蜂鸣器
- 机械开关去抖
- 通用 I/O 电平转换

## 3 说明

SN74LXCH1T45 是一款 1 位双电源同相双向电压电平转换器件，具有总线保持电路。I/O 引脚 A 和控制引脚 (DIR) 以  $V_{CCA}$  逻辑电平为基准，I/O 引脚 B 以  $V_{CCB}$  逻辑电平为基准。A 端口能够接受 1.1V 至 5.5V 的 I/O 电压，而 B 端口可接受 1.1V 至 5.5V 的 I/O 电压。DIR 上为高电平时允许数据从 A 传输到 B，而 DIR 上为低电平时允许数据从 B 传输到 A。请参阅 [器件功能模式](#)，简要了解控制逻辑的运行。

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

			MIN	MAX	UNIT
V <sub>CCA</sub>	Supply voltage A		- 0.5	6.5	V
V <sub>CCB</sub>	Supply voltage B		- 0.5	6.5	V
V <sub>I</sub>	Input Voltage <sup>(2)</sup>	I/O Ports (A Port)	- 0.5	6.5	V
		I/O Ports (B Port)	- 0.5	6.5	
		Control Inputs	- 0.5	6.5	
V <sub>O</sub>	Voltage applied to any output in the high-impedance or power-off state <sup>(2)</sup>	A Port	- 0.5	6.5	V
		B Port	- 0.5	6.5	
V <sub>O</sub>	Voltage applied to any output in the high or low state <sup>(2) (3)</sup>	A Port	- 0.5	V <sub>CCA</sub> + 0.5	V
		B Port	- 0.5	V <sub>CCB</sub> + 0.5	
I <sub>IK</sub>	Input clamp current	V <sub>I</sub> < 0	- 50		mA
I <sub>OK</sub>	Output clamp current	V <sub>O</sub> < 0	- 50		mA
I <sub>O</sub>	Continuous output current		- 50	50	mA
	Continuous current through V <sub>CC</sub> or GND		- 200	200	
T <sub>J</sub>	Junction Temperature			150	°C
T <sub>stg</sub>	Storage temperature		- 65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure beyond the limits listed in *Recommended Operating Conditions* may affect device reliability.
- (2) The input voltage and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The output positive-voltage rating may be exceeded up to 6.5 V maximum if the output current rating is observed.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 8 Detailed Description

### 8.1 Overview

The SN74LXCH1T45 is a 1-bit translating transceiver that uses two individually configurable power-supply rails. The device is operational with  $V_{CCA}$  and  $V_{CCB}$  supplies as low as 1.1 V and as high as 5.5 V. Additionally, the device operates with  $V_{CCA} = V_{CCB}$ . The A port is designed to track  $V_{CCA}$ , and the B port is designed to track  $V_{CCB}$ .

The SN74LXCH1T45 device is designed for asynchronous communication between data buses and transmits data from the A bus to the B bus or from the B bus to the A bus based on the logic level of the direction-control input (DIR). The control pin of the SN74LXCH1T45 (DIR) is referenced to  $V_{CCA}$ .

This device is fully specified for partial-power-down applications using the  $I_{off}$  current. The  $I_{off}$  protection circuitry ensures that no excessive current is drawn from or sourced into an input, output, or I/O while the device is powered down.

The  $V_{CC}$  isolation and  $V_{CC}$  disconnect feature ensures that if either  $V_{CC}$  is less than 100 mV or floating with the complementary supply within the recommended operating conditions, both I/O ports are set to the high-impedance state by disabling their outputs and the supply current is maintained.

Glitch-free power supply sequencing allows either supply rail to power on or off in any order while providing robust power sequencing performance.

### 8.2 Functional Block Diagram

Note: Bus-hold circuits are only present for data inputs, not control inputs

### 8.3 Feature Description

#### 8.3.1 CMOS Schmitt-Trigger Inputs

Standard CMOS inputs are high impedance and are typically modeled as a resistor in parallel with the input capacitance given in the [Electrical Characteristics](#). The worst case resistance is calculated with the maximum input voltage, given in the [Absolute Maximum Ratings](#), and the maximum input leakage current, given in the [Electrical Characteristics](#), using ohm's law ( $R = V \div I$ ).

The Schmitt-trigger input architecture provides hysteresis as defined by  $\Delta V_T$  in the [Electrical Characteristics](#), which makes this device extremely tolerant to slow or noisy inputs. Driving the inputs slowly will increase dynamic current consumption of the device. See [Understanding Schmitt Triggers](#) for additional information regarding Schmitt-trigger inputs.

##### 8.3.1.1 Control Inputs with Integrated Static Pull-Down Resistors

Similar to the data I/O's, floating control inputs can cause high current consumption. This device has integrated weak static pull-downs of 5-M $\Omega$  typical on the control inputs (DIR and  $\overline{OE}$ ) to help avoid this concern. These pull-downs are always present. For example, if the DIR pin is left floating, then the B port will be configured as an input and the A port will be configured as an output.

### 8.3.2 Balanced High-Drive CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The high drive capability of this device creates fast edges into light loads so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. The electrical and thermal limits defined in the [Absolute Maximum Ratings](#) must be followed at all times.

### 8.3.3 Partial Power Down ( $I_{off}$ )

The inputs and outputs for this device enter a high-impedance state when the device is powered down, inhibiting current backflow into the device.  $I_{off}$  in the [Electrical Characteristics](#) specifies the maximum leakage into or out of any input or output pin on the device.

### 8.3.4 $V_{CC}$ Isolation and $V_{CC}$ Disconnect

The inputs and outputs for this device enter a high-impedance state when either supply is  $<100$  mV, requiring one supply to connect to the device. Note: the bus-hold circuitry always remains active even when the device is disabled and all outputs are in the high-impedance state.

Either supply can be disconnected (floated), while the other supply is still connected and the device will maintain the maximum supply current specified by  $I_{CCx(floating)}$  in the [Electrical Characteristics](#). The I/O's will not enter a high-impedance state unless the supply is disconnected after it is driven to  $<100$  mV.  $I_{off(float)}$  in the [Electrical Characteristics](#) specifies the maximum leakage into or out of any input or output pin on the device.

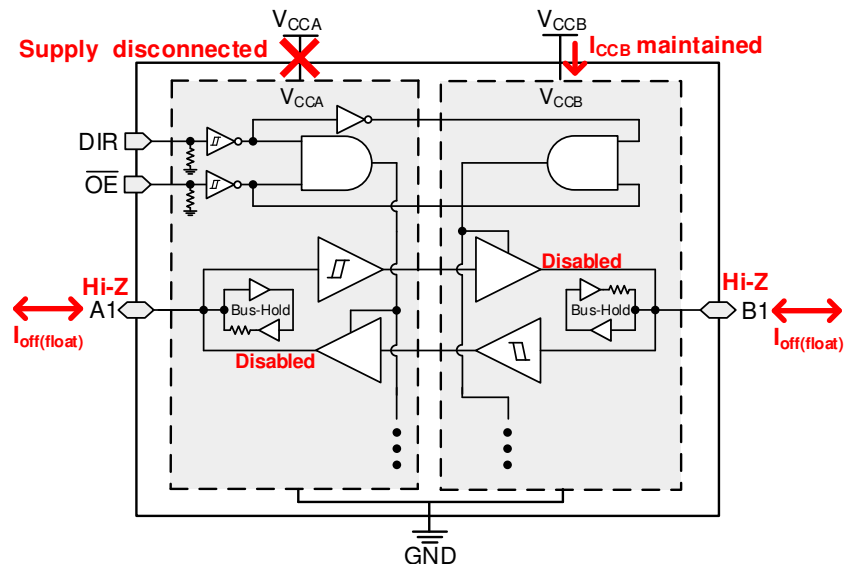

图 8-1.  $V_{CC}$  Disconnect Feature

### 8.3.5 Over-Voltage Tolerant Inputs

Input signals to this device can be driven above the supply voltage as long as they remain below the maximum input voltage value specified in the [Recommended Operating Conditions](#).

### 8.3.6 Glitch-Free Power Supply Sequencing

Either supply rail may be powered on or off in any order without producing a glitch on the I/Os (that is, where the output erroneously transitions to V<sub>CC</sub> when it should be held low or vice versa). Glitches of this nature can be misinterpreted by a peripheral as a valid data bit, which could trigger a false device reset of the peripheral, a false device configuration of the peripheral, or even a false data initialization by the peripheral.

### 8.3.7 Negative Clamping Diodes

The inputs and outputs to this device have negative clamping diodes as depicted in [图 8-2](#).

**CAUTION**

Voltages beyond the values specified in [节 6.1](#) table can cause damage to the device. The input negative-voltage and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

**图 8-2. Electrical Placement of Clamping Diodes for Each Input and Output**

### 8.3.8 Fully Configurable Dual-Rail Design

The  $V_{CCA}$  and  $V_{CCB}$  pins can be supplied at any voltage from 1.1 V to 5.5 V, making the device suitable for translating between any of the voltage nodes (1.2 V, 1.5 V, 1.8 V, 3.3 V, and 5.0 V).

### 8.3.9 Supports High-Speed Translation

The SN74LXCH1T45 device can support high data-rate applications. The translated signal data rate can be up to 420 Mbps when the signal is translated from 3.3 V to 5.0 V.

### 8.3.10 Bus-Hold Data Inputs

Each data input on this device includes a weak latch that maintains a valid logic level on the input. The state of these latches is unknown at startup and remains unknown until the input has been forced to a valid high or low state. After data is sent through a channel, the latch maintains the previous state on the input (if the line is left floating). It is not recommended to use pull-up or pull-down resistors together with a bus-hold input, as it may cause undefined inputs to occur which leads to excessive current consumption.

Bus-hold data inputs prevent floating inputs on this device. The [Implications of Slow or Floating CMOS Inputs](#) application report explains the problems associated with leaving the CMOS inputs floating. These latches remain active at all times, independent of all control signals such as direction control or output enable. The latches also remain active when the device is in the partial power down state, corresponding supply is still present, or when the I/O's are floated. The [Bus-Hold Circuit](#) application report has additional details regarding bus-hold inputs.

## 8.4 Device Functional Modes

表 8-1. Function Table<sup>(1)</sup>

CONTROL INPUTS		PORT STATUS		OPERATION
OE	DIR	A PORT	B PORT	
L	L	Output (Enabled)	Input (Hi-Z)	B data to A bus
L	H	Input (Hi-Z)	Output (Enabled)	A data to B bus
H	X	Input (Hi-Z)	Input (Hi-Z)	Isolation

(1) Input circuits of the data I/Os are always active.

## 9 Application and Implementation

### 备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The SN74LXCH1T45 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The SN74LXCH1T45 device is ideal for use in applications where a push-pull driver is connected to the data I/O. The maximum data rate can be up to 420 Mbps when the device translates a signal from 3.3 V to 5.0 V.

### 9.2 Enable Times

Calculate the enable times for the SN74LXCH1T45 using the following formulas:

$$t_{A\_en} (\text{DIR to A}) = t_{dis} (\text{DIR to B}) + t_{pd} (\text{B to A}) \quad (1)$$

$$t_{B\_en} (\text{DIR to B}) = t_{dis} (\text{DIR to A}) + t_{pd} (\text{A to B}) \quad (2)$$

In a bidirectional application, these enable times provide the maximum delay time from the time the DIR bit is switched until an output is expected. For example, if the SN74LXCH1T45 initially is transmitting from A to B, then the DIR bit is switched; the B port of the device must be disabled ( $t_{dis}$ ) before presenting it with an input. After the B port has been disabled, an input signal applied to it appears on the corresponding A port after the specified propagation delay ( $t_{pd}$ ). To avoid bus contention, care should be taken to not apply an input signal prior to the output being disabled ( $t_{dis}$  maximum).

### 9.3 Typical Application

#### 9.3.1 Design Requirements

Use the parameters listed in 表 9-1 for this design example.

表 9-1. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUES
Input voltage range	1.1 V to 5.5 V
Output voltage range	1.1 V to 5.5 V

### 9.3.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range:
  - Use the supply voltage of the device that is driving the SN74LXCH1T45 device to determine the input voltage range. The value must exceed the high-level input voltage ( $V_{IH}$ ) of the input port for a valid logic-high. The value must be less than the low-level input voltage ( $V_{IL}$ ) of the input port for a valid logic low.
- Output voltage range:
  - Use the device's supply voltage that the SN74LXCH1T45 device is driving to determine the output voltage range.

### 9.3.3 Application Curve

图 9-2. Up Translation at 2.5 MHz (1.2 V to 5 V)

## 10 Power Supply Recommendations

Always apply a ground reference to the GND pins first. This device is designed for glitch free power sequencing without any supply sequencing requirements such as ramp order or ramp rate.

节 8.3.6 describes how this device was designed with various power supply sequencing methods in mind to help prevent unintended triggering of downstream devices.

## 11 Layout

### 11.1 Layout Guidelines

Following common printed-circuit board layout guidelines are recommended to ensure reliability of the device, which follows:

- Use bypass capacitors on the power supply pins and place them as close to the device as possible. A 0.1  $\mu\text{F}$  capacitor is recommended, but transient performance can be improved by having both 1  $\mu\text{F}$  and 0.1  $\mu\text{F}$  capacitors in parallel as bypass capacitors.
- The high drive capability of this device creates fast edges into light loads; so routing and load conditions should be considered to prevent ringing.

#### 12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
