

带有可编程涌入转换率的 3V 至 20V 高电流负载开关

 查询样品: [TPS25910](#)

特性

- 3V 至 20V 总线运行电压
- 集成的 30mΩ 导通金属氧化物半导体场效应晶体管 (MOSFET)
- 可编程电流限制从: **0.83A 至 6.5A**
- 可编程涌入电流转换率
- 热关断和故障警报
- 4mm x 4mm 四方扁平无引线 (QFN)-16 封装
- -40°C 至 125°C 的结温范围

应用范围

- 固态硬盘 (SSD)
- 硬盘驱动器 (HDD)
- RAID 阵列
- 电信
- 插入式电路板
- 笔记本电脑和上网本

说明

TPS25910 器件在负载电源电压为 3V 和 20V 的应用中提供高度集成的热插拔电源管理和出色的保护。这个器件用于必须在有害的持续和瞬态过载时对电压总线提供保护的系统。

在启动时或热插入系统总线时, TPS25910 通过控制输出电压, V_{OUT} , 来限制涌入电流。可使用 GATE 引脚和 GND 引脚之间的一个电容器来调节 V_{OUT} 的转换率。

内置 SOA 保护可确保内部 MOSFET 在最恶劣的工作条件下在一个安全运行区间 (SOA) 内运行。此外, 可使用 ILIM 引脚与 GND 引脚之间的一个电阻器来调节与功率限值无关的电流限制阈值。

TPS25910 在过热故障时提供一个故障指示器输出。

TPS25910 采用 16 引脚四方扁平无引线 (QFN) 封装。

12-V, 4.75-A APPLICATION

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

DEVICE	JUNCTION TEMPERATURE	PACKAGE	ORDERING CODE	MARKING

ABSOLUTE MAXIMUM RATINGS

over device junction temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
Input voltage range IN, OUT	-0.3	22	V
Voltage range, GATE	-0.3	30	
Voltage range \overline{FLT}	-0.3	20	V
Voltage ILIM		1.75	
Output sink current \overline{FLT}		10	mA
Input voltage range, \overline{EN}	-0.3	6	
Voltage range ILIM ⁽³⁾	-0.3	3	V
ESD rating, HBM		2 .5 k	
ESD rating, CDM		500	
Operating junction temperature range, T_J	Internally Limited		°C
Storage temperature range, T_{stg}	-65	150	

- (1) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to GND.
- (3) Do not apply voltage to pin.

RECOMMENDED OPERATING CONDITIONS

over device junction temperature range (unless otherwise noted)

PARAMETER	MIN	NOM	MAX	UNIT
Input voltage range V_{IN} , V_{OUT}	3		20	V
Voltage range \overline{EN}	0		5	
Voltage range \overline{FLT}	0		20	
Continuous output current I_{OUT}	0		5	A
Output sink current \overline{FLT}	0		1	mA
External Capacitor, GATE	1		47	nF
dV/dt , $V_{IN}^{(1)}$			12	V/ μ S
$R_{LIM}^{(2)}$	0		237k	Ω
Junction temperature	-40		125	$^{\circ}$ C

 (1) dV/dt , V_{IN} should be limited to 12 V/ μ S to confine the shoot-through current to the load.

 (2) When R_{LIM} value is beyond this range, I_{LIM} will not be as accurate as within this range.

TPS25910 FUNCTIONAL BLOCK DIAGRAM

Figure 1. Functional Block Diagram

TPS25910 PIN ASSIGNMENT

PIN FUNCTIONS

PIN NAME	PIN NUMBER	DESCRIPTION
\overline{EN}	16	Device is enabled when this pin is pulled low.
IN	1, 2, 3	Power In and control supply voltage.
GATE	4	If the chip die temperature exceeds the OTSD rising threshold, GATE is pulled down to GND by a 7.5KOhm resistor.
ILIM	7	A resistor to ground sets the current limit level.
GND	5, 6, 8, 9, 13, 14	GND
OUT	10, 11, 12	Output to the load.
\overline{FLT}	15	Fault low indicates that the internal pass FET junction temperature exceeds the thermal shutdown threshold

PIN DESCRIPTION

FLT: Open-drain output that pulls low during thermal shutdown. $\overline{\text{FLT}}$ activates when device thermally shuts down and deactivates when die temperature cools down below the device thermal protection threshold and the device ends thermal shutdown cycle. FLT becomes operational before UV, when V_{IN} is greater than 1V.

GND: This is the most negative voltage in the circuit and is used as reference for all voltage measurements unless otherwise specified. All the GND pins must be connected to system power supply negative return point

GATE: Output that provides gate drive for the internal pass FET. Its sourcing current is about 11 μA . An internal clamp prevents GATE from rising 6.6 V above OUT. C_{INT} is 200 pF.

The GATE pin is disabled by the following mechanisms:

1. When $\overline{\text{EN}}$ is above its rising threshold, GATE is pulled down by a 40- Ω resistor connecting to GND for approximately 50 μs . Then, a 7.5-k Ω resistor ties GATE to GND to ensure the GATE is off.
2. When V_{IN} drops below the UVLO threshold, GATE is pulled down by a 40- Ω resistor connecting to GND for approximately 50 μs . Then, a 7.5-k Ω resistor ties GATE to GND to ensure the GATE is off.
3. When short circuit fault occurs, GATE is pulled down by a 40- Ω resistor connecting to GND for approximately 50 μs . Then, a 500 μA current source continues to pull down on the GATE.
4. If the chip die temperature exceeds the OTSD rising threshold, GATE is pulled down to GND by a 7.5-k Ω resistor.

An external capacitor can be connected from GATE pin to GND pin to create linear inrush profile. The slew rate of the inrush can be controlled by a different capacitor value.

$$I_{\text{CHARGE}} = (C_{\text{EXT}} + C_{\text{INT}}) \frac{dV_{\text{OUT}}}{dt} \quad (1)$$

Where:

I_{CHARGE} is 11 μA (typical)

C_{INT} , the equivalent gate input capacitance of the internal FET (200 pF typical).

ILIM: A resistor connected from this pin to ground sets $I_{(\text{LIM})}$. R_{LIM} is set by the formula:

$$R_{\text{LIM}} = \frac{197.388}{I_{\text{LIM}}^{0.976944}} \quad \text{for currents below 2 A where } R_{\text{LIM}} \text{ is in k}\Omega. \quad (2)$$

$$R_{\text{LIM}} = \frac{205.62}{I_{\text{LIM}}^{1.02912}} \quad \text{for currents above 2 A where } R_{\text{LIM}} \text{ is in k}\Omega. \quad (3)$$

EN: When this pin is pulled low, the device is enabled. The input threshold is hysteretic, allowing the user to program a startup delay with an external RC circuit. $\overline{\text{EN}}$ is pulled to V_{IN} by a 10-M Ω resistor, pulled to GND by 16.8 M Ω and is clamped to ground by a 7-V Zener diode. Because high impedance pullup and or down resistors are used to reduce current draw, any external FET controlling this pin should be low leakage.

IN: Input voltage to the TPS25910. The recommended operating voltage range is 3 V to 20 V. All V_{IN} pins should be connected together and to the power source.

OUT: Output connection for the TPS25910. When switched on, the output voltage is approximately:

$$V_{\text{OUT}} = V_{\text{IN}} - 0.04 \times I_{\text{OUT}} \quad (4)$$

All OUT pins should be connected together and to the load.

TYPICAL CHARACTERISTICS

Figure 5.

APPLICATION INFORMATION

Programming the Current-Limit Threshold

The over-current threshold is user programmable via an external resistor. The TPS25910 uses an internal regulation loop to provide a regulated voltage on the ILIM pin. The current-limit threshold is proportional to the current sourced out of ILIM. The recommended 1% resistor range for R_{LIM} is $0\text{ k}\Omega \leq R_{LIM} \leq 237\text{ k}\Omega$ to ensure stability of the internal regulation loop. Many applications require that the minimum current limit is above a certain current level or that the maximum current limit is below a certain current level, so it is important to consider the tolerance of the over-current threshold when selecting a value for R_{LIM} . Consult the Electrical Characteristics table for specific current limit settings. The traces routing the R_{LIM} resistor to the TPS25910 should be as short as possible to reduce parasitic effects on the current-limit accuracy.

Equation 5 through Equation 7 can be used to estimate current limit below 2 A:

$$I_{LIM(min)} = \frac{1051.9}{R_{LIM(max)}^{1.3854}} \quad (5)$$

$$I_{LIM(typ)} = \frac{223.61}{R_{LIM(typ)}^{1.0236}} \quad (6)$$

$$I_{LIM(max)} = \frac{104.95}{R_{LIM(min)}^{0.8347}} \quad (7)$$

Equation 8 through Equation 10 can be used to estimate current limit above 2 A:

$$I_{LIM(min)} = \frac{161.24}{R_{LIM(max)}^{0.9796}} \quad (8)$$

$$I_{LIM(typ)} = \frac{176.85}{R_{LIM(typ)}^{0.9717}} \quad (9)$$

$$I_{LIM(max)} = \frac{194.81}{R_{LIM(min)}^{0.9694}} \quad (10)$$

where $R_{LIM(max)}$ is the maximum resistor value in factoring in error, $R_{LIM(typ)}$ is the typical resistor value, and $R_{LIM(min)}$ is the minimum resistor value factoring in error. All resistor values are represented in $\text{k}\Omega$. For example, a 100- $\text{k}\Omega$, 1% resistor would have the following values:

- $R_{LIM(min)} = 99\text{ k}\Omega$
- $R_{LIM(typ)} = 100\text{ k}\Omega$
- $R_{LIM(max)} = 101\text{ k}\Omega$

A plot of the current limit threshold vs. RLIM using equations Equation 5 through Equation 10 above is shown in Figure 6.

Figure 6. Current Limit Threshold vs. RLIM

G001

Slew Rate Control Using C_{GATE}

The TPS25910 can be used with applications that require constant turn-on currents. The current is controlled by a single capacitor from the GATE terminal to ground. The TPS25910 internal MOSFET appears to operate as a source follower (following the gate voltage) in this implementation. Choose a time to charge, Δt, based on the output capacitor, input voltage V_I, and desired charge current, I_{CHARGE}. Select the device load to be less than 5 W ÷ V_{IN}.

$$\Delta t = \frac{C_{LOAD} \times V_{IN}}{I_{C-LOAD}} \tag{11}$$

To select the gate capacitance:

$$C_{EXT} = I_{CHARGE} \times \frac{\Delta t}{V_{IN}} - C_{INT} \tag{12}$$

- I_{CHARGE} = 11 μA
- C_{INT} = 200 pF (typical)

Figure 7 and Figure 8 illustrate the effects of C_{EXT} = 0.1 μF on inrush current using TPS25910EVM-088.

Figure 7. Typical Power Limited Inrush Start Up (no C_{EXT})

Figure 8. Start Up With Slew Rate Control ($C_{EXT} = 0.1 \mu F$)

Thermal Sense

The TPS25910 self protects by using a thermal sensing circuit that monitors the operating temperature of the power switch and disables operation if the temperature exceeds the thermal shutdown condition (160°C typical). The TPS25910 device operates in power-limit mode during an overload condition and increases the voltage drop across power switch. The thermal sensor turns off the power switch when the die temperature exceeds 160°C. Hysteresis is built into the thermal sensor, and the switch turns on after the device has cooled approximately 20°C. Figure 9 below illustrates the thermal behavior during output overload.

Figure 9. Thermal Sense Behavior

Back-to-Back (B2B) FET Operation

Many applications require reverse current blocking (from load to input source) so that pending system activities can be completed (such as writing important data to non-volatile memory) prior to power down or during brown out. TPS25910 provides the GATE pin externally for slew rate control, but this external connection can also be used to control an external blocking MOSFET, Q1 as shown in Figure 10.

As V_{IN} drops during input power removal, the comparator circuit de-asserts ENb, GATE falls, and both the TPS25910 internal MOSFET and Q1 is turned off and block any current flow from V_{LOAD} to V_{IN} . C_{LOAD} can then be chosen to furnish the required load current for long enough to complete the required power down system activities.

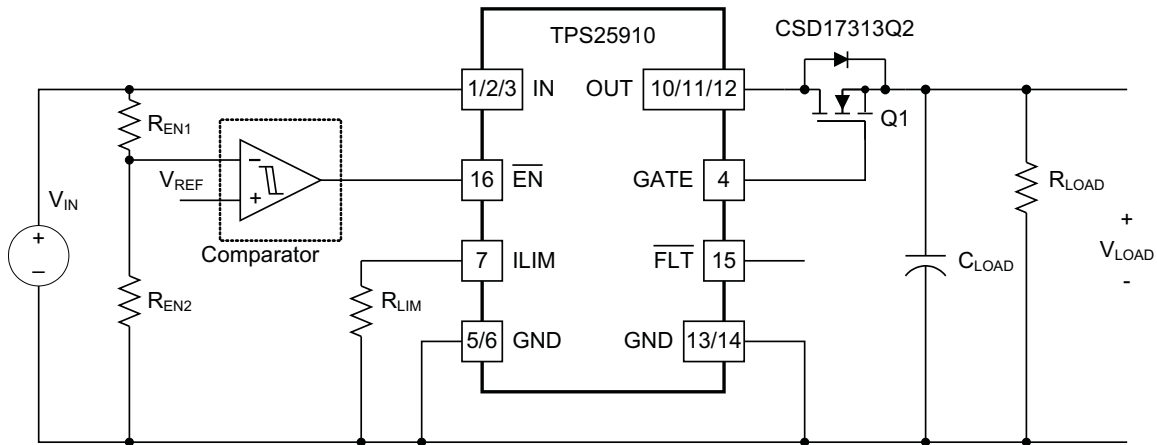

Figure 10. B2B Implementation

NOTE

Connecting the load voltage to the non-inverting input of the external comparator can provide a simple ORing function that prevents holdup energy in C_{LOAD} from discharging through the TPS25910 to $V_{IN(source)}$ when $V_{IN(source)}$ droops or collapses.

Circuit operation is illustrated in Figure 11 and Figure 12. Figure 11 shows the power down event with no load at the output. When V_{IN} drops to approximately 10 V (threshold of comparator circuit), ENb is de-asserted and GATE falls and enables reverse current blocking. The voltage on C_{LOAD} then stops following V_{IN} and remains flat for a long duration.

Figure 11. B2B Performance with No-Load

Figure 12 illustrates the power down event with a 200-mA load. As V_{IN} starts to fall, the output load is supplied by C_{LOAD} . C_{LOAD} must be large enough to support V_{LOAD} for long enough for the power down activities to complete. For the case shown in Figure 12, C_{LOAD} is a 3900- μF capacitor and can support a droop from approximately 10 V to approximately 5 V for approximately 170 ms.

TPS3700DDC (dual comparator with wide input voltage range) can be used for the B2B comparator circuit shown in Figure 10. Only one comparator is needed, but the second comparator can be utilized as either a power good flag or as a notification to the system load that a brownout or power down event is about to occur.

Figure 12. B2B Performance with 200-mA Load

Maximum Load at Startup

The power limiting function of the TPS25910 provides effective protection for the internal FET. Expectedly, there is a supply voltage dependent maximum load which the device is able to power up. Loads above this level may cause the device to shut off current before startup is complete. Neglecting any load capacitance, the maximum load (minimum load resistance) is calculated using Equation 13;

$$R_{\text{MIN}} = \frac{V_{\text{IN}}^2}{12} \quad (13)$$

Adding load capacitance may reduce the maximum load which can be present at start up.

If $\overline{\text{EN}}$ is tied to GND at startup and IN does not ramp quickly, the TPS25910 may momentarily turn off then on during startup. This can happen if a capacitive load pulls down the input voltage below the UV threshold. If necessary, this can be avoided by delaying the $\overline{\text{EN}}$ assertion until VIN is fully up.

Transient Protection

The need for transient protection in conjunction with hot-swap controllers should always be considered. When the TPS25910 interrupts current flow, input inductance generates a positive voltage spike on the input and output inductance generates a negative voltage spike on the output. Such transients can easily exceed twice the supply voltage if steps are not taken to address the issue. Typical methods for addressing transients include;

- Minimizing lead length/inductance into and out of the device.
- Transient Voltage Suppressors (TVS) on the input to absorb inductive spikes.
- Shottky diode across the output to absorb negative spikes.
- A combination of ceramic and electrolytic capacitors on the input and output to absorb energy.

The following equation estimates the magnitude of these voltage spikes:

Where;

$$V_{\text{SPIKE(absolute)}} = V_{\text{NOM}} + I_{\text{LOAD}} \times \sqrt{\frac{L}{C}} \quad (14)$$

- V_{NOM} equals the nominal supply voltage.
- I_{LOAD} equals the load current.
- C equals the capacitance present at the input or output of the TPS25910.
- L equals the effective inductance seen looking into the source or the load.

The inductance due to a straight length of wire equals approximately.

Where;

$$L_{\text{straightwire}} \approx 0.2 \times L \times \ln\left(\frac{4 \times L}{D} - 0.75\right) \text{ (nH)} \quad (15)$$

- L equals the length of the wire.
- D equals wire diameter.

Some applications may require the addition of a TVS to prevent transients from exceeding the absolute ratings if sufficient capacitance cannot be included.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS25910RSAR	ACTIVE	QFN	RSA	16	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	TPS 25910	
TPS25910RSAT	ACTIVE	QFN	RSA	16	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	TPS 25910	

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
